PREFACE

At the end of the 2002/03 Agriculture Year, the National Bureau of Statistics and the Office of the Chief Government Statistician in Zanzibar in collaboration with the Ministries of Agriculture and Food Security; Water and Livestock Development; Cooperatives and Marketing as well as the Presidents Office, Regional Administration and Local Government (PORALG) conducted the Agriculture Sample Census. This is the third Agriculture Census to be carried out in Tanzania, the first one was conducted in 1971/72, the second in 1993/94 and 1994/95 (during 1993/94 data on household characteristics and livestock count were collected and data on crop area and production in 1994/95).

It is considered that this census is one of the largest to be carried out in Africa and indeed in many other countries of the world. The census collected detailed data on crop production, crop marketing, crop storage, livestock production, fish farming, tree farming, access to infrastructures and services and poverty indicators.

In addition to this, the census was large in its coverage as it provides data that can be disaggregated at district level and thus allow comparisons with the 1998/99 District Integrated Agricultural Survey. The census covered smallholders in rural areas only and large scale farms. This report presents Morogoro region data disaggregated to district level. It was very difficult to discuss all variables collected in a single report hence the analysis was based on the most important smallholder variables. The rest of the variables are found in the attached annex of table of results. The analysis in the report includes time series comparisons using data from the previous censuses and surveys.

The extensive nature of the census in relation to its scope and coverage is a result of the increasing demand for more detailed information to assist in the proper planning of this sector and in the administrative decentralization of planning to district level. It is hoped that this report will provide new insights for planners, policy makers, researchers and others involved in the agricultural sector in order to improve the prevailing conditions faced by crop producers and livestock keepers in the country.

On behalf of the Government of Tanzania, I wish to express my appreciation for the financial support provided by the development partners, in particular, the European Union as well as DFID, UNDP, Japanese Government, JICA and others who contributed through the pool fund mechanism.

Finally, my appreciation goes to all those who in one-way or the other contributed to the success of the survey. In particular, I would also like to mention the enormous effort made by the Planning Group composed of professionals from the Agriculture Statistics Department of the National Bureau of Statistics (NBS), the Office of the Chief Government Statistician in Zanzibar (OCGS) and the Statistics Unit of the Ministry of Agriculture and Food Security (MAFS) with technical assistance provided by Ultec Lawrence Gould (ULG), Scotts Agriculture Consultancy Ltd and the Food and Agriculture Organisation of the United Nations (FAO).

Additionally, I would like to extend my appreciation to all professional staff of the National Bureau of Statistics, the sector Ministries of Agriculture and PORALG, the Consultants as well as Regional and District Supervisors and field enumerators for their commendable work. Certainly without their dedication, the census would not have been such a success.

Cletus P. B. Mkai
The Director General
National Bureau of Statistics

EXECUTIVE SUMMARY

The executive summary highlights the main survey results obtained during the National Sample Census of Agriculture 2002/03. This report covers small-scale agriculture households in rural areas of Morogoro region who were selected using statistical sampling techniques. The results in the report do not cover urban areas and large-scale farmers.

The highlights describe the important findings in relation to agricultural production, productivity, husbandry, access to resources, levels of involvement in agricultural related activities and poverty in Morogoro region activities indicators for one to get an overview, at regional level, of the rural agricultural households and their levels of involvement in agricultural related activities.

i) Household Characteristics

The number of agricultural households in Morogoro region were 265,198 out of which 178,406 (67.2%) were involved in growing crops only, 1,477 (0.6%) rearing livestock only, 194 (0.1%) were pastoralist, and 85,121 (32%) were involved in crop production as well as livestock keeping. In summary, Morogoro region had 259,246 households involved in crop production and 36,524 involved in livestock production.

Most of the agricultural households ranked annual crop farming as an activity that provides most of their cash income followed by off farm income, tree/forest resources, livestock keeping/herding, permanent crop farming, remittances and fishing/hunting and gathering.

The region has a literacy rate of 68 percent. The highest literacy rate is in Mvomero district (77%) followed by Kilombero district (73%), Morogoro Urban district (70%), Morogoro Rural (68%), Kilosa (67%) and Ulanga (66%). The literacy rate for the heads of households in the region was 77.2 percent.

The number of heads of agricultural households with formal education in Morogoro region was 196,247 (72%), those without formal education were 59,504 (23%) and those with only adult education were 4,995 (2%). The majority of heads of agricultural households (72%) had primary level education whereas less than 0.2 percent had post primary education.

In Morogoro region 139,109 household members (53%) were involved in one off-farm income generating activity, 79,217 (30%) involved in two off-farm income generating activities and 28,027 (11%) involved in more than two off-farm income generating activities.

ii) Crop Production

▪ Land Area

The total area of land available to smallholders was 558,133 ha. The regional average land area utilised for crop production per crop growing household was only 1.8 ha. This figure is below the national average of 2.0 hectares.

▪ Planted Area

The area planted with annual crops and vegetables was 414,604 hectares out of which 127,604 hectares (31%) were planted during short rainy season and 286,546 hectares (69%) during long rainy season.

An estimated area of 337,461 ha (81.5% of the total planted area with annual and vegetable crops) was with cereals, followed by 28,556 hectares (6.9%) of pulses, 22,301 ha (5.4%) of roots and tubers, 12,735 ha (3.1%) of oil seed, 12,400 hectares (3.0%) of fruit and vegetable, and 698 ha (0.2%) of cash crops.

- **Maize**

Maize is the dominant annual crop grown in Morogoro region and it had a planted area 1.5 times greater than paddy, which had the second largest planted area. The area planted with maize constitutes 47 percent of the total area planted with annual crops. Other crops in order of their importance (based on area planted) are beans, cassava, sorghum, simsim, tomatoes, sweetpotatoes, groundnuts, cabbage and cocoyam.

The yield of maize has dropped over the previous 10 years, the quantity produced has increased and this has been due to a large increase in the area under production. The area planted with maize increased from 1994/95 to 2000/03. The peak area recorded under maize production was in 1999/00 (242,544 ha). However, the yield of maize has shown a gradual decline over the years since 1994/95 (from 2.1t/ha in 1994/95 to 0.6 t/ha in 2003)

- **Paddy**

Paddy is the second most important cereal crop in the region in terms of planted area. The number of households that grew paddy in Morogoro region during the long rainy season was 109,655. This represented 49 percent of the total crop growing households in Morogoro region in the long rainy season.

- **Cassava**

The area planted with cassava was larger than any other root and tuber crop in Morogoro in terms of planted area (4% of the total area planted with annual crops and vegetables) and it accounted for 77 percent of the area planted with roots and tubers.

- **Fruit and Vegetables**

The total production of fruit and vegetables was 42,229 tonnes. The most cultivated fruit and vegetable crop was tomatoes. The production for this crop was 21,747 tonnes, which amounts to 51 percent of the total fruit and vegetable production, followed by cabbage 10,374 tonnes (25%), onion 4686 tonnes (11%), pumpkins 1,877 tonnes (4%), chillies 973 tonnes (2%), and amaranths 849 tonnes (2%). The production of the other fruit and vegetable crops was relatively small.

- **Permanent Crops**

The area of smallholders planted area with permanent crops was 50,712 hectares which is 11 percent of the area planted with annual crops in the region. The most important permanent crop is bananas which accounts for 19 percent of the total area planted with permanent crops followed by sugarcane (16%), coconut (15%) and mango (10%).

- **Improved Seeds**

The planted area using improved seeds was 55,330 ha which represents 14 percent of the total planted area with the annual crops and vegetables. The percentage use of improved seed in the long rainy season was 14.1 percent which is slightly higher than the corresponding percentage use for the short rainy season (13.6%).

- **Use of Fertilizers**

Most annual crop growing households do not use any fertiliser. The planted area without fertiliser for annual crops was 112,856 hectares representing 89 percent of the total planted area with annual crops. Of the planted area with fertiliser application, inorganic fertiliser was applied to 13,038 ha which represented 5 percent of the total planted area (44 % of the area planted with fertiliser application). This was followed by farm yard manure (10,901 ha, 40%). Compost fertilizers were used on a very small area and represented only 2 percent of the area planted with fertilizers.

- **Irrigation**

In Morogoro region, the area of annual crops and vegetables under irrigation was 64,685 ha representing 16 percent of the total area planted. The area under irrigation during the short rainy season was 6,810 ha accounting for 11 percent of the total area under irrigation. However, the percentage of the planted area under irrigation during the long rainy season was 20 percent compared with 5 percent in the short rainy season.

▪ **Crop Storage**

There were 336,432 crop growing households (15.3% of the total crop growing households) that reported storing various agricultural products in the region.

The most important stored crop was paddy with 99,430 households storing 19870 tonnes as of 1st January 2004. This was followed by maize (183,248 households and 17,805 tonnes), sorghum and millet (15,471 households and 1,436 tonnes) and beans and pulses (35,134 households and 955 tonnes) and groundnuts (1,524 household and 154 tonnes). The rest of the crops were stored in very small amounts.

▪ **Crop Marketing**

The number of households that reported selling crop was 182,902 which represent 70.1 percent of the total number of crop growing households. The percent of crop growing households selling crops was highest in Kilombero (87%) followed by Morogoro Urban (76%), Ulanga (74%), Morogoro Rural (69%), Mvomero (69%) and Kilosa (60%).

▪ **Agricultural Credit**

In Morogoro region, few agricultural households (11,457, 4.4%) accessed credit, out of which 7,799 (68%) were male-headed households and 3,658 (32%) were female headed households. In Kilosa district only male headed households got credit for agriculture purposes, whereas in Mvomero district more female household got agricultural credit than male household.. In the remaining districts both male and female headed households accessed credit.

▪ **Crop Extension Services**

The number of agricultural households that received crop extension was 67,368 (26% of total crop growing households in the region). Some districts have more access to extension services than others (Chart 3.96). Ulanga district had a relatively high proportion of households that received crop extension messages (37%), followed by Mvomero (35%), Kilombero (32%), Kilosa (21%), Morogoro Rural (13%) and Morogoro Urban (10%).

▪ **Soil Erosion and Water Harvesting Facilities**

The number of agricultural households that reported the presence of soil erosion and water harvesting facilities in their farms was 8,894. This number represents 3 percent of total number of agricultural households in the region. The proportion of farmers with soil erosion control and water harvesting facilities was highest in Mvomero district (28%) followed by Kilosa (26%), Morogoro Rural (20%), Kilombero (11%), Ulanga (9%) and Morogoro Urban (6%).

iii) **Livestock and Poultry Production**

▪ **Cattle**

The total number of cattle in the region was 455,985. Cattle rearing is the dominant livestock type in the region followed by goats, sheep and pigs. The region had 2.7 percent of the total cattle population on the Tanzanian Mainland. The number of indigenous cattle was 455,985 head (98.9% of the total number of cattle in the region), 5,052 (1.1%) were dairy breeds and only 26 (0.005%) were beef breeds.

- **Goats**

The number of goat-rearing-households in the region was 27,920 (4.3% of all agricultural households) with a total of 243,175 goats giving an average of 9 head of goats per goat-rearing-households.

- **Sheep**

The number of sheep-rearing households was 7,442 (1.2% of all agricultural households) with a total of 95,680 sheep giving an average of 13 heads of sheep per sheep-rearing household.

- **Pigs**

The number of pig-rearing households in the region was 18,088 (2.8% of the total agricultural households) rearing about 44,986 pigs. This gives an average of 3 pigs per pig-rearing household.

- **Chicken**

The number of households keeping chickens was 154,850, raising 2,100,861 chickens. This gives an average of 14 chickens per chicken-rearing household. In terms of total number of chickens in the country Morogoro ranked sixth out of the 21 Mainland regions.

- **Use of Draft Power**

The region has 20,104 oxen and they were found in Ulanga 10,281, Kilombero 6,466, Kilosa 2,591 and Mvomero 766. Morogoro region has 0.9 percent of the total 2,233,927 head of oxen found on the Mainland and were used to cultivate 17,218 hectares of land.

- **Fish Farming**

The number of households involved in fish farming was 902 (0.3 percent of the total agricultural households in the region). Kilombero was the leading district with 369 agricultural households involved in fish farming (41%) followed by Morogoro Rural 363 (40%), Kilosa 93 (10%) and Ulanga 76 (8%). Fish farming was not practiced in Morogoro Urban and Mvomero districts.

iv) Poverty Indicators

- **Availability of Toilets**

It was estimated that 94.7 percent of all rural agricultural households used the traditional pit latrines, 2.2 percent used improved pit latrine and 1.2 percent had flush toilets. The remaining 0.2 percent of households had other unspecified types of toilets. Households with no toilet facilities represent 2.7 percent of the total agriculture households in the region.

- **Household Assets**

Out of all assets, radios had the highest percent of households owning them (58% of households) followed by bicycle (38.7%), iron (13.6%), wheelbarrow (4.1%), mobile phone (1.6%), landline phone (0.3%), vehicle (0.2%) and television/video (0.0%).

- **Source of Lighting Energy**

Wick lamp is the most common source of lighting energy in the region. About 70.5 percent of the total rural households used this source of energy followed by hurricane lamp (22.4%), pressure lamp (4.3%), mains electricity (1.1%), firewood (1.2%), candle (0.1%), gas or biogas (0.1%) and solar (0.1%),

▪ **Energy for Cooking**

The most prevalent source of energy for cooking was firewood, which was used by 92.2 percent of all rural agricultural households. The second most common source of energy for cooking was charcoal (6.3%). The rest of energy sources accounted for 1.5 percent. These were bottled gas (0.22%), crop residues (0.46%), mains electricity (0.21%), solar (0.20%), livestock dung (0.03%), paraffin/kerosene (0.35%) and none for gas/biogas.

▪ **Roofing Materials**

The most used roofing material (for the main dwelling) was grass and/or leaves and it was used by 54 percent of the rural agricultural households however, this was closely followed by iron sheets (36.2%). Other roofing materials are grass/mud (8.4%), asbestos (0.2%), tiles (0.8%), concrete (0.4%) and others (0.1%).

▪ **Number of Meals per Day**

About 53.2 percent of the holders in the region took two meals per day, 42.6 percent took three meals, 3.5 percent took one meal and 0.7 percent took four meals.

▪ **Food Security**

Households which seldom had problems in satisfying their food needs represent 34.8 percent of the total number of agriculture households in the region. Households with recurring food shortage problems represent 11.2 percent whereas those with little problems represent 8.1 percent. About 8.7 percent of agriculture households always faced food shortages whilst 37.2 percent had not experienced any food shortage problems.

▪ **Main Source of Cash Income**

Selling of food crops was the main cash income earning activity reported by 56.8 percent of all rural agricultural households. The second main cash income earning activity was casual labour (11.8%) followed by selling of cash crops (9.6%), businesses (8.8%) and cash remittances (2.3%). Other income earning activities were employment (3.2%), sale of livestock (1.6%), sale of forest products (4.3%), sale of livestock products (0.5%) and fishing (0.4%).

3.1	The Livelihood Activities/Source of Income of the Households Raked in Order of Importance by District	10
3.2	Area, Production and Yield of cereal crops by Season	16
3.3	Area planted and quantity harvested by season and type of root and tuber crop	18
3.4	Area, Quantity Harvested and Yield of Pulses by Season	20
3.5	Area, Quantity Harvested and Yield of Oil Seed Crops by Season	21
3.6	Area, Production and Yield of Fruits and Vegetables by Season	22
3.7	Area, Production and Yield of Annual Cash Crops by Season	25
3.8	Land Clearing Methods	29
3.9	Number of Crop Growing Households and Planted Area (ha) by Fertilizer Use and District during the Long Rainy Season	31
3.10	Number of Households Storing Crops by Estimated Storage Loss and District	39
3.11	Reasons for Not Selling Crop Produce	42
3.12	Number of Agricultural Households that Received Credit by Sex of Household head and District	43
3.13	Total Number of Households and Chickens Raised by Flock Size	49
3.14	Head Number of Other Livestock by Type of Livestock and District	50
3.15	Number of Households by Distance to Nearest Veterinary Clinic and District	51
3.16	Number of Households by Distance to Nearest Village Watering Points/Dams and District	52
3.17	Mean distances from holders dwellings to infrastructures and services by districts	53
3.18	Number of Households by Number of meals the Household normally has per Day and District	55

List of Charts

3.1	Percentage Distribution of Agricultural Households by Type of Holdings	10
3.2	Percentage Distribution of Agricultural Households by Sex of Household Head	11
3.3	Percentage Distribution of Population by Age and Sex in 2003	11
3.4	Percentage Literacy level by District	11
3.5	Literacy Rates for Heads of Household by Gender and District	12
3.6	Percentage of Population Aged 5 years and above by District and Educational Status	12
3.7	Percentage of Population Aged 5 years and Above in Agricultural Households by Education Status	12
3.8	Percentage Distribution of Heads of Household by Educational Attainment	12
3.9	Percentage Distribution of Agricultural Households by Number of Off-farm Activities	13
3.10	Percentage Distribution of Agricultural Households by Number of Off-farm Activities	13
3.11	Utilized and Usable Land per Household by District	13
3.12	Percentage Distribution of Land Area by Type of Land Use	14
3.13	Area Planted with Annual Crops by season (ha)	14
3.14	Area Planted with Annual Crops (ha) by Season and District	14
3.15	Area Planted with Annual Crops per Household by Season and District	14
3.16	Planted Area for the Main Annual Crops (ha)	15
3.17a	Planted Area per Household by Selected Crop	15
3.17b	Percentage Distribution of Area Planted with Annual Crops by Crop Type	15
3.18	Area planted with Annual Crops by Type of Crops and Season	15
3.19	Area Planted and Yield of Major Cereal Crops	16
3.20	Time Series Data On Maize Production	16
3.21	Maize: Total Area Planted and Planted Area per Household by District	17
3.22	Time Series of Maize Planted Area and Yield	17
3.23	Total Planted Area and Area of Paddy per Household by District	17
3.24	Time Series Data on Paddy Production	17
3.25	Time Series of Paddy Plated Area and Yield	18
3.26	Area planted with Paddy, Sorghum and Bulrush millets by District	18
3.27	Area Planted and Yield of Major Pulse Crops	19
3.28	Area Planted with Root Crops during the Census/Survey year	19
3.29	Percent of Beans Planted Area and Percent of Total Land with Beans by District	20
3.30	Beans Planted Area per Beans Growing Household by District	20
3.31	Time Series of Beans Planted Area and Yield	21
3.32	Percent of Cassava Planted Area and Percent of Total Land with Cassava by District	21

3.33	Cassava Planted Area per Cassava Growing Household by District	21
3.34	Area Planted and Yield of Major Oil Seed Crops	22
3.35	Percent of Simsim Planted Area and Percent of Total Land with Simsim by District	22
3.36	Area Planted per Simsim Growing Household by District (Long Rainy Season Only)	22
3.37	Area Planted and Yield of Fruit and Vegetables	23
3.38	Percent of Tomato Planted Area and Percent of Total Land with Tomato by District	23
3.39	Area Planted per Tomato Growing Household by District (Short Rainy Season Only)	24
3.40	Percent of Cabbage Planted Area and Percent of Total Land with Cabbage by District	24
3.41	Percent of Carrots Planted Area and Percent of Total Land with Carrots by District	24
3.42	Area planted with Annual Cash Crops	25
3.43	Percent of Tobacco Planted Area and Percent of Total Land with Tobacco by District	25
3.44	Area Planted for Annual and Permanent Crops	26
3.45	Area Planted with the Main Permanent Crops	26
3.46	Percent of Area Planted and Average Planted Area with Permanent Crops by District	26
3.47	Percent of Area Planted with Banana and Average Planted Area per Household by District	26
3.48	Percent of Area Planted with Sugarcane and Average Planted Area per Household by District	27
3.49	Percent of Area Planted with Coconut and Average Planted Area per Household by District	27
3.50	Percent of Area Planted with Mango and Average Planted Area per Household by District	28
3.51	Number of Households by Method of Land Clearing During the Long Rainy Season	28
3.52	Area Cultivated by Cultivation Method	29
3.53	Area Cultivated by Method of Cultivation and District	29
3.54	Planted Area with Improved Seed by Crop Type	30
3.55a	Percentage of Crop Type Planted Area with Improved Seed – Annuals	30
3.55b	Percentage Area with Improved Seed by Crop Type	30
3.56	Area of Fertilizer Application by Type of Fertilizer	30
3.57	Area of Fertilizer Application by Type of Fertilizer and District	30
3.58	Planted Area with Farm Yard Manure by Crop Type - Long Rainy Season	31
3.59	Percentage of Crop Type Planted Area with Farm Yard Manure – Annuals	31
3.60	Planted Area with Inorganic Fertiliser by Crop Type - Long rainy season	32
3.61	Percentage of Crop Type Planted Area with Inorganic Fertilizers – Annuals	32
3.62	Planted Area with Compost by Crop Type - Long rainy season	32
3.63	Planted area (ha) by Pesticide use	33
3.64	Planted Area applied with Pesticide by Crop Type	33
3.65	Percentage of Crop Type Planted Area applied with Pesticide	33
3.66	Proportion of Planted Area applied with Insecticides by District during the Long Rainy Season	33
3.67	Planted Area Applied with Herbicides by Crop Type	34
3.68	Percentage of Crop Type Planted Area applied with Herbicides	34
3.69	Proportion of Planted Area applied with Herbicides by District during the Long Rainy Season	34
3.70	Planted Area applied with Fungicides by Crop Type	34
3.71	Percentage of Crop Type Planted Area applied with Fungicides	34
3.72	Proportion of Planted Area applied with Fungicides by District during the Long Rainy Season	35
3.73	Area of Irrigated Land	35
3.74	Planted Area and Percentage of Planted Area with Irrigation by District	36
3.75	Number of Households with Irrigation by Source of Water	36
3.76	Number of Households by Method of Obtaining Irrigation Water	36
3.77	Number of Households with Irrigation by Method of Field Application	37
3.78	Number of Households and Quantity Stored by Crop Type	37
3.79	Number of households by Storage Methods	37
3.80	Number of households by method of storage and District (based on the most important household crop)	38
3.81	Normal Length of Storage for Selected Crops	38
3.82	Quantity of Maize Produced (tonnes), Stored and Percent Stored by District	38
3.83	Number of Households by Purpose of Storage and Crop Type	39
3.84	Percentage of Households Processing Crops by District	39
3.85	Percentage of Households Processing Crops by District	40
3.86	Percent of Crop Processing Households by Method of Processing	40
3.87	Percent of Households by Type of Main Processing Product	40
3.88	Number of Households by Type of By-product	41
3.89	Use of Processed Product	41
3.90	Percentage of Households Selling Processed Crops by District	41
3.91	Location of Sale of Processed Product	41
3.92	Percent of households Selling Processed products by Outlet for sale and District	42
3.93	Number of Crop Growing Households Selling Crops by District	42

3.94	Percentage Distribution of Households that Reported Marketing Problems by Type of Problem	43
3.95	Percentage Distribution of households that Received Credit by Main Sources	43
3.96	Proportion of Households Receiving Credit by Main Purpose of the Credit	44
3.97	Number of Households Receiving Extension Advice	44
3.98a	Number of Households Receiving Extension by District	44
3.99	Number of Households Receiving Extension by Quality of Services	45
3.100	Number of Households by Source of Inorganic Fertiliser	45
3.101	Number of Households Reporting Distance to Source of Inorganic Fertiliser	45
3.102	Number of households by source of Improved Seed	45
3.103	Number of Households reporting Distance to source of Improved seed	46
3.104	Number of Households by source of Insecticide/Fungicide	46
3.105	Number of Household reporting Distance to source of insecticides/Fungicide	46
3.106	Number of Households with Planted Trees	47
3.107	Number of Planted Trees by Species	46
3.108	Number of Trees Planted by Smallholders by Species and Region	48
3.109	Number of Trees Planted by Location	48
3.110	Number of Households by Purpose of Planted Trees	48
3.111	Number of Households with Erosion Control/Water Harvesting Facilities	48
3.112	Number of Households with Erosion Control/Water Harvesting Facilities	49
3.113	Number of Erosion control/Water Harvesting Structures by Type of Facility	49
3.114	Total Number of cattle	50
3.115	Number of cattle by Type and District	50
3.116	Cattle population trend	50
3.117	Dairy Cattle Population Trend	50
3.118	Number of Goats ('000') by District	51
3.119	Goat population Trend	51
3.120	Total Number of Sheep by District	52
3.121	Sheep Population Trend	53
3.122	Total Number of Pigs by District	54
3.123	Pig Population Trend	54
3.124	Total Number of chickens by District	54
3.125	Chicken Population Trend	54
3.126	Number of Improved Chicken (Layers and Broilers)	54
3.127	Layers Population Trend	55
3.128	Percentage of Livestock Keeping Households Reporting Tsetse flies and tick Problems by district	56
3.129	Percent of Livestock Rearing Households that De wormed Livestock by Livestock Type and district	50
3.130	Percentage Distribution of Livestock Rearing Households by Quality of Livestock Extension Services	50
3.131	Number of Household by distance to Veterinary Clinic	51
3.132	Number of household sto distance to Veterinary clinic and district	51
3.133	Number of households by Distance to village watering Points	52
3.134	Number of Households by Distance to Village watering Point and district	53
3.135	Number of households Using Draft Animals	54
3.136	Number of Households Using draft Animals by District	54
3.137	Number of Households Using Organic fertiliser	54
3.138	Area of Application of Organic Fertiliser by District	54
3.139	Number of Households Practicing Fish Farming	54
3.140	Number of Households practicing Fish farming by district	55
3.141	Fish Production	56
3.142	Agricultural Households by Type of Toilet Facility	56
3.143	Percentage Distribution of Households Owning the Assets	50
3.144	Percentage Distribution of Households by Main source of Energy for Lighting	50
3.145	Percentage Distribution of Households by Main Source of Energy for Cooking	51
3.146	Percentage Distribution of Households by Type of Roofing Material	51
3.147	Percentage distribution of Households with Grass/Leafy Roofs by District	52
3.148	Percent of Households by Main Souse of Drinking Water and Season	53
3.149	Percent of Households by Distance to Main Source of drinking Water and Season	54
3.150	Number of agricultural Households by Number of Meals per Day	54
3.151	Number of Households by Frequency of Meat and Fish Consumption	54
3.152	Percentage Distribution of the number of Households by Main Source of Income	54

1. BACKGROUND INFORMATION

1.1 Introduction

This part of the report presents a brief description of the regional profile by providing information on geographical location, land area, climate, administrative set up, population and socio-economic indicators. The information will provide the user with general understanding of the region and its resources.

1.2 Geographical Location and Boundaries

Morogoro region is located in the Mid – Eastern part of Tanzania mainland. The region lies between latitudes 5° 58' and 10' south of the equator and between longitude 35° 25' and 38° 30' East Greenwich.

To the north Morogoro region shares boarders with Arusha and Tanga regions. To the east and southeast, it shares boarders with Ruvuma and Lindi regions respectively. To the west and southwest it shares borders with Dodoma and Iringa regions respectively.

1.3 Land Area

1.4 Climate

1.4.1 Temperatur

Morogoro region has an average temperature of 24° C. The minimum is 18° C in mountainous areas and has a maximum of 30° C in lowland areas. The coolest months are May, June and July, while the hottest months are September and October.

1.4.2 Rainfall

Altitudes vary considerably from one district to another. The main rain season is from November to May, while the dry season in from June to October. The topographical variations in different parts of the region explain the existing variations in the climatic conditions. The variation in rainfall is between 500 mm in low areas and 2,200 mm in the mountainous areas.

1.5 Population

According to the 2002 Population and Housing Census, there were 1,759,809 inhabitants in Morogoro region. The population of Morogoro region ranked 6th of the 21 regions in Tanzania.

1.6 Socio - Economic Indicators

The regional Gross Domestic Product (GDP) at current prices for the year 2003 was estimated to be TShs 439,520 million with a per capita income of shillings 249,754. The region held 8th position among regions on GDP and contributed about 4.5 percent to the national GDP¹

The region headquarter can easily be reached by road from Dar es Salaam, Dodoma and Iringa towns. It is also the centre for travelers going to Dodoma, Tabora, Lake zone and Kigoma by train.

The region has a tourist attraction – Mikumi National Park that is about 100 kilometers from Morogoro town and about 300 kilometers from Dar es Salaam and Selous game reserve.

The region is famous for producing both food and cash crops. The main food crops produced in Morogoro region include: maize, paddy, sorghum, bulrush millets and beans. The main cash crops include cotton and tobacco. Livestock keeping is also an important economic activity in the region.

2.1 INTRODUCTION

This part of the report provides the technical and operational description of the National Sample Census of Agriculture (NSCA), carried out in the rural areas of Tanzania Mainland and Zanzibar during the 2002/03 agricultural year. It details the background and the rationale for carrying out the NSCA in 2002/03 agricultural year. It also explains the sampling procedures, designing and implementation of the data processing system.

2.2 The Rationale for Conducting the National Sample Census of Agriculture

In 2003, the Government of Tanzania launched the Agricultural Sample Census as an important part of the Poverty Monitoring Master Plan which supports the production of statistics for advocacy of effective public policy, including poverty reduction, access to services, gender, as well as the standard crop production data normally collected in an agriculture census. The census is intended to fill the information gap and support planning and policy formulation by high level decision making bodies. It is also meant to provide critical benchmark data for monitoring Agriculture Sector Development Programme (ASDP) and other agriculture and rural development programs as well as prioritising specific interventions of most agriculture and rural development programs.

Following the decentralisation of the Government's administration and planning functions, there has been a pressing need for agriculture and rural development data disaggregated at regional and district levels. The provision of district level estimates will provide essential baseline information on the state of agriculture and support decision making by the Local Government Authorities in the design of District Agricultural Development and Investment Projects (DADIPS). The increase in investment is an essential element in the national strategy for growth and reduction of poverty.

This report (Volume V) is among the 21 regional reports for the mainland. Other Census reports include the Technical Report (Volume I), crop sector at national and regional levels including Zanzibar estimates (Volume II), Livestock Report (Volume III), Smallholder Household Characteristics and Access to Natural Resources Report (Volume IV), 21 Regional Reports for the Mainland (Volume V), Large Scale Farms Report (Volume VI) and a separate report for Zanzibar (Volume VII). In order to address the specific issue of gender, a separate thematic report on gender has been published. Other thematic reports will be produced depending on the demand and availability of funds. In addition to these reports two dissemination applications have been produced to allow users to create their own tabulations, charts and maps.

The report is divided into five main sections: Background Information, Introduction, Results, Evaluation and Conclusion and Appendices. The definitions relating to all aspects of this report can be found in the questionnaire (Appendix III).

2.3 Census Objectives

The 2003 Agriculture Sample Census was designed to meet the data needs of a wide range of users down to district level including policy makers at local, regional and national levels, rural development agencies, funding institutions, researchers, Non government Organisations (NGOs), farmer organisations, etc. As a result, the dataset is both more numerous in its sample and detailed in its scope compared to previous censuses and surveys. To date this is the most detailed Agricultural Census carried out in Africa. The census was carried out in order to:

- Identify structural changes if any, in the size of farm household holdings, crop and livestock production, farm input and implement use. It also seeks to determine if there are any improvements in rural infrastructure and in the level of agriculture household living conditions;

-
- Provide benchmark data on productivity, production and agricultural practices in relation to policies and interventions promoted by the Ministry of Agriculture and Food Security and other stake holders.
 - Establish baseline data for the measurement of the impact of high level objectives of the Agriculture Sector Development Programme (ASDP), National Strategy for Growth and Reduction of Poverty (NSGRP) and other rural development programs and projects.
 - Obtain benchmark data that will be used to address specific issues such as: food security, rural poverty, gender, agro-processing, marketing, service delivery, etc.

2.4 Census Coverage and Scope

The census was conducted for both large and small scale farms. The National Sample Census of Agriculture covered a total of 3,221 selected rural villages of Tanzania Mainland out of which 215 villages were from Tanga region.

The census covered agriculture in detail as well as many other aspects of rural development and was conducted using three types of questionnaires:

- Small scale farm questionnaire
- Community level questionnaire
- Large scale farm questionnaire

The small scale farm questionnaire was the main census instrument and it includes questions related to crop and livestock production and practices; population demographics; access to services, resources and infrastructure; issues on poverty, gender and subsistence versus profit making production units. The main sections covered are as follows:

- Identification (i.e. region, district, ward and village)
- Household and holding characteristics
- Household information
- Land ownership/tenure
- Land use
- Access and use of resources
- Crop and vegetable production
- Agro processing and by-Products
- Crop storage and marketing
- On-farm investment
- Access to farm inputs and implements
- Use of credit for agricultural purposes
- Tree farming/agro-forestry
- Crop extension services
- Livelihood constraints
- Animal contribution to crop production
- Livestock
- Livestock products
- Fish farming
- Livestock extension

-
- Labour use
 - Access to infrastructure and other services
 - Household facilities

The community level questionnaire was designed to collect village level data such as access and use of common resources, community tree plantation and seasonal farm gate prices.

The large scale farm questionnaire was administered to large scale farms that were either privately or corporately managed. There will be a national report on large scale farming on Tanzania Mainland.

2.5 Legal Authority of the National Sample Census of Agriculture

The NSCA 2002/03 was conducted under the legal authority of the 2000 National Bureau of Statistics Act which, among other things, makes data collected from individuals strictly confidential and to be used for statistical purposes only.

2.6 Reference Period

Two types of reference periods were used namely the agricultural year and the reference date for livestock enumeration. The agricultural year 2002/03 (that is October 2002 to September 2003) was used for the data items that are related to crop production. The reference date of enumeration for livestock and poultry count was 1st October 2003.

2.7 Census Methodology

The main focus at all stages of the census execution was on data quality and this is emphasised in this section. The main activities undertaken include:

- Census organisation
- Tabulation plan preparation
- Sample design
- Design of census questionnaires and other instruments.
- Field pretesting of the census instruments
- Training of trainers, supervisors and enumerators
- Information Education and Communication (IEC) campaign
- Data Collection
- Field supervision and consistency checks
- Data processing:
 - Scanning
 - ICR extraction of data
 - Structure formatting application
 - Batch validation application
 - Manual data entry application
 - Tabulation preparation using SPSS
- Table formatting and charts using Excel, map generation using ArcView and Freehand.
- Report preparation using Word and Excel.

2.7.1 Census Organization

The Census was conducted by the National Bureau of Statistics in collaboration with the sector ministries of agriculture, and the Office of the Chief Government Statistician in Zanzibar. At the national level the Census was headed by the Director General of the National Bureau of Statistics with assistance from the Director of Economic Statistics. The Planning Group, made up of staff from the National Bureau of Statistics, Department of Agricultural Statistics and three representatives from the Ministry of Agriculture and Food Security (Department of Policy and Planning), oversaw the overall operational aspects of the Census. At the regional level, implementation of census activities was overseen by the Regional Statistical Officer of NBS and the Regional Agriculture Supervisor from the Ministry of Agriculture and Food Security. At the District level, two supervisors from the President's Office, Regional Administration and Local Government (PORALG), managed the enumerators who also came from the same ministry.

Members of the Planning Group had a minimum qualification of a bachelor degree, the regional supervisors were either agricultural economists, statisticians or statistical officers. The district supervisors and enumerators had diploma level qualifications in agriculture.

The Census and Surveys Technical Working Group provided support in sourcing financing, approving budget allocations and technical assistance inputs as well as monitoring the progress of the census. A Technical Committee for the census was established with members from key stakeholder organisations (i.e. NBS, sector ministries of agriculture, President's Office, Planning and Privatization (POPP), PORALG, University of Dar es Salaam (UDSM), Tanzania Food and Nutrition Centre (TFNC) and the Office of Chief Government Statistician (OCGS) in Zanzibar). The main function of the committee was to approve the proposed instruments and procedures developed by the Planning Group. It also approved the tabulations and analytical reports prepared from the Census data.

2.7.2 Tabulation Plan

The tabulation plan was developed following three user group workshops and thus reflects the information needs of the end users. It took into consideration the tabulations from previous census and surveys to allow trend analysis and comparisons.

2.7.3 Sample Design

The Mainland sample consisted of 3,221 villages. These villages were drawn from the National Master Sample (NMS) developed by the National Bureau of Statistics (NBS) to serve as a national framework for the conduct of household based surveys in the country. The National Master Sample was developed from the 2002 Population and Housing Census. In most cases, within each selected village, data was collected from a sub-sample of fifteen agricultural households. In few large villages thirty households were selected. The total Mainland sample was 48,315 agricultural households. In Zanzibar a total of 317 EAs were selected and 4,755 agricultural households were covered. Nationwide, all regions and districts were sampled with the exception of three urban districts (two from Mainland and one from Zanzibar).

In both Mainland and Zanzibar a stratified two stage sample was used. In the first stage, villages/enumeration areas (EAs) were selected with probability proportional to the number of villages in each district. In the second stage, 15 households were selected from a list of

Table 2.1: Census Sample Size

Number of	Mainland	Zanzibar	Total
Households	48,315	4,755	53,070
Villages/Eas	3,221	317	3,539
Districts	117	9	126
Regions	21	5	26

farming households in each Village/EA using systematic random sampling. Table 2.1 gives the sample size of households, villages and districts for Tanzania Mainland and Zanzibar.

2.7.4 Questionnaire Design and Other Census Instruments

The census questionnaires were designed following user/producer meetings to ensure that the information collected was in line with their data needs. Several features were incorporated into the design of the questionnaire to increase the accuracy of the data:

- Where feasible all variables were extensively coded to reduce post enumeration coding error.
- The definitions for each section were printed on the opposite page so that the enumerator could easily refer to the instructions whilst interviewing the farmer.
- The responses to all questions were placed in boxes printed on the questionnaire, with one box per character. This feature made it possible to use scanning and ICR technologies for data entry.
- Skip patterns were used to avoid asking unnecessary questions
- Each section was clearly numbered, which facilitated the use of skip patterns and provided a reference for data type coding for the programming of CPro, SPSS and the dissemination applications.

Besides the questionnaires, there were other instruments used:

- Village listing forms that were used for listing households in the villages and from these list a systematic sample of 15 agricultural households were selected from each village.
- Training manual which was used by the trainers for the cascade/pyramid training of supervisors and enumerators. This manual was trainers guiding document on the procedures to follow during the training
- Enumerator Instruction Manual which was used as reference material.

2.7.5 Field Pre-Testing of the Census Instruments

The Questionnaire was pre-tested in five locations (Arusha, Dodoma, Tanga, Unguja and Pemba). This was done purposely to test the wording, flow and relevance of the questions and to finalise crop lists, questionnaire coding and manuals. In addition to this, several data collection methodologies had to be finalised, namely, livestock numbers in pastoralist communities, cut flower production, mixed cropping, use of percentages in the questionnaire and finalising skip patterns and documenting consistency checks.

2.7.6 Training of Trainers, Supervisors and Enumerators

Cascade/pyramid training techniques were employed to maintain statistical standards. The top level training was provided to 66 national and regional supervisors (3 per region plus Zanzibar). The trainers were members of the Planning Group and the trainees were from the National Bureau of Statistics and the sector ministries of agriculture. The second level training was for the district supervisors and enumerators. This training was conducted in the regions. In each region three training sessions were conducted for the district supervisors and enumerators. In addition to training in field level Census methodology and definitions, emphasis was placed on training the enumerators and supervisors in consistency checking. Tests were given to the enumerators and supervisors and the best 50 percent of the trainees were selected to administer the smallholder and community level questionnaires. This increased the number of interviews per enumerator but it also released finance to increase the number of supervisors and hence the Supervisor Enumerator Ratio. The household listing exercise was carried out by all trained enumerators.

2.7.7 Information, Education and Communication (IEC) Campaign

Information, Education and Communication (IEC) is an important aspect of any census/survey undertaking. This is due to the fact that inadequately informed and hence uncooperative citizens may jeopardize the entire census/survey. As far as the 2002/03 Agricultural Sample Census was concerned, the main objective of the IEC program was to sensitize and mobilize Tanzanians to support, cooperate and participate in the census exercise.

Radio, television, newspapers, leaflets, t-shirts and caps were used to publicise the Sample Census. T-shirts and caps were used by the field staff and the village chairmen as official uniforms during the field work. The village chairmen helped to locate the selected households.

2.7.8 Household Listing

The household listing exercise was done in seven days. During the listing exercise, forms ACLF1 and ACLF2 were administered. The information collected included the number of fields operated by the household, the number of different types of livestock and poultry. This information was used to determine the agricultural households. From the list of agricultural households, 15 households were selected for the interview. The selection was done using the Random Number Table.

2.7.9 Data Collection

Data collection activities for the 2002/2003 Agricultural Sample Census took three months from January to March 2004. The data collection methods used during the census were by interview and no physical measurements, e.g., crop cutting and field area measurement were taken. Field work was monitored by a hierarchical system of supervisors at the top of which was the Mobile Response Team followed by the national, regional, and district supervisors.

The Mobile Response Team consisted of three principal supervisors who provided overall direction to the field operation and responded to queries arising outside the scope of the training exercise. The mobile response team consisted of the Manager of Agriculture Statistics Department, Long-term Consultant and Desk Officer for the Census. Decisions made on definitions and procedures were then communicated back to all enumerators via the national, regional and district supervisors.

District supervision and enumeration were done by staff from the President's Office, Regional Administration and Local Government (PORALG). National and regional supervisions were provided by senior staff of the National Bureau of Statistics and the sector ministries of agriculture. During the household listing exercise 3,221 extension staff were used. For the enumeration of the small holder questionnaire, 1,611 enumerators were used and additional 5 percent enumerators were held in reserve in case of drop outs during the enumeration exercise.

2.7.10 Field Supervision and Consistency Checks

Enumerators were trained to probe the respondents until they were satisfied with the responses given before they recorded them in the questionnaire. The first check of the questionnaires was done by enumerators in the field during enumeration. The second check was done by the district supervisors followed by regional and national supervisors. Supervisory visits at all levels of supervision focused on consistency checking of the questionnaires. Inconsistencies encountered were corrected, and where necessary a return visit to the respondent was made by the enumerator to obtain the correct

information. Further quality control checks were made through a major post enumeration checking exercise where all questionnaires were checked for consistencies by all supervisors in the district offices.

2.7.11 Data Processing

Data processing consisted of the following processes:

- Manual editing
- Data entry
- Data structure formatting
- Batch validation
- Tabulation
- Illustration production
- Report formatting

Manual Editing

Prior to scanning, all questionnaires underwent a manual cleaning exercise. This involved checking that the questionnaire had a full set of pages, correct identification and good handwriting. A score was given to each questionnaire based on the legibility and the completeness of enumeration. This score will be used to assess the quality of enumeration and supervision in order to select the best field staff for future censuses/surveys.

Data entry/Scanning and ICR extraction technologies

Scanning and ICR data capture technology was used for the small holder questionnaire. This not only increased the speed of data entry, it also increased the accuracy due to the reduction in keystroke errors. Interactive validation routines were incorporated into the ICR software to track errors during the verification process. The scanning operation was so successful that it is highly recommended that this technology be adopted for future censuses/surveys.

The Census and Surveys Processing Program (CSPro) was used to enter 2,880 of small holder questionnaires that were rejected by the Intelligent Character Recognition (ICR) extraction application.

Data structure formatting

A program was developed in visual basic to automatically alter the structure of the output from the scanning/extraction process in order to harmonise it with the manually entered data. The program automatically checked and changed the number of digits for each variable, the record type code, the number of questionnaires in the village, the consistency of the Village Identification (ID) code and saved the data of one village in a file named after the village code.

Batch validation

A batch validation program was developed in order to identify inconsistencies within a questionnaire. This is in addition to the interactive validation during the ICR extraction process. The procedures varied from simple range checking within each variable to more complex checking between variables. It took six months to screen, edit and validate the data from the smallholder questionnaire. After the long process of data cleaning, the results were prepared based on a pre-designed tabulation plan.

Tabulations

Statistical Package for Social Sciences (SPSS) was used to produce the Census results and Microsoft Excel was used to organize the tables and compute additional indicators.

Analysis and report preparation

The analysis in this report focuses on regional and district production estimates, districts comparisons and time series analysis. Microsoft Excel was used to produce charts; whereas Microsoft Word was used to compile the report.

Data quality

A great deal of emphasis was placed on data quality throughout the whole exercise from planning, questionnaire design, training, supervision, data entry, validation and cleaning/editing. As a result of this NBS believes that the Census is highly accurate and representative of what was experienced at field level during the Census year. With very few exceptions the variables in the questionnaire are within the norms for Tanzania and they follow expected time series trends when compared to historical data. Standard Errors and Coefficients of Variation for the main variables can be found in the Technical Report (Volume I).

2.7 Funding Arrangements

The Agricultural Sample Census was supported mainly by the European Union (EU) who financed most of the operational activities. Other funds for operational activities came from the Government of Tanzania, Government of Japan, United Nations Development Programme (UNDP) and other partners in the Pool Fund of the Vice President's Office (VPO). In addition to this, technical assistance was provided by the European Union (EU), Department for International Development (DFID) and Japanese International Cooperation Agency (JICA). Technical assistances were managed by Ultek Laurence Gould Consultants (ULG), Scotts Agriculture Consultancy Ltd (SAC) and the Food and Agriculture Organisation (FAO).

3. CENSUS RESULTS

This part of the report presents the results of the census data for Morogoro region which are based on the data tables presented in Appendix A2. The results are presented in different forms including brief summaries, charts, condensed tables and graphs and Maps in order to make it easier for the users to understand. Comparisons are made between related variables and between districts. Comparisons are also made with past censuses/surveys results such as the 1994/95 National Sample Census of Agriculture (NSCA), the 1995/96 and the 1996/97 Expanded Agricultural Surveys, the 1997/98 Integrated Agricultural Survey, the 1998/99 District Integrated Agricultural Survey and the 1999/00 Rapid Agricultural Appraisal Survey. The presentation of results is divided into four main sections which are household characteristics, crop results, livestock results and poverty indicators. More effort has been placed in analyzing the results in order to formulate solid conclusions than in previous censuses and surveys.

3.1 Household Characteristics

3.1.1 Type of Household

The number of agricultural households in Morogoro region was 260,746. The largest number of agriculture households was in Kilosa (73,435) followed by Morogoro Rural (53,117), Mvomero (50,069), Kilombero (48,782), Ulanga (30,908) and Morogoro Urban (4,434) (Map 3.1). The highest density of household was found in Mvomero (20 km²) and Kilosa (14km²) (Map 3.2). Most household (224,222, 86%) were involved in growing crops only, 1,500 (0.6%) rearing livestock only and 35,024, (13%) were involved in crop production as well as livestock keeping (Chart 3.1) (Map 3.3,3.4,3.5 and 3.6)

3.1.2 Livelihood Activities/Source of Income

The census results for Morogoro region indicates that most of the agricultural households ranked annual crop farming as an activity that provides most of their cash income followed by off farm income, tree/forest resources, livestock, keeping/herding, permanent crop farming, remittances and fishing/hunting (Table 3.1).

Table 3.1 The Livelihood Activities/Source of Income of the Households Ranked in Order of Importance by District

District	Livelihood Activity						
	Annual Crop Farming	Permanent Crop Farming	Livestock Keeping / Herding	Off Farm Income	Remittances	Fishing / Hunting & Gathering	Tree / Forest Resources
Kilosa	1	5	4	2	6	7	3
Morogoro	1	4	5	2	6	7	3
Kilombero	1	4	5	2	6	7	3
Ulanga	1	5	4	2	6	7	3
Morogoro Urb	1	3	5	4	6	7	2
Mvomero	1	5	4	3	6	7	2
Total	1	5	4	2	6	7	3

3.1.3 Sex and Age of Heads of Households

The number of male-headed agricultural households in Morogoro region was 209,037 (80% of the total regional agricultural households) whilst for female-headed households the number was 51,709 (20% of the total regional agricultural households). The mean age of household heads was 44 years (43 years for male heads and 45 years for female heads)

The percentage trend for six censuses/surveys years shows that there has not been any significant change in the distribution of agricultural households between male and female headed households (Chart 3.2).

3.1.4 Number and Age of Household Members

Morogoro region had a total rural agricultural population of 1,235,577 of which 614,454 (50%) were males and 621,124 (50%) were females. Whereas age group 0-14 constituted 41 percent of the total rural agricultural population, age group 15-64 (active population) was only 55 percent. Morogoro region had an average household size of 5 with Kilosa and Morogoro Urban districts having the lowest household size of 4 (Chart 3.3).

3.1.5 Level of Education

In order to obtain information on the level of education, information on literacy and education attainment were obtained for all persons aged five years and above in all households.

Literacy

The information on literacy level for family members aged five years and above was obtained by asking individual private households if their respective family members could read and write in Kiswahili only, English only, both English and Swahili or in any other language. Literacy is based on the ability to read and write Swahili, English or both.

Literacy Level for Household Members

Morogoro region had a total literacy rate of 68 percent. The highest literacy rate was found in Mvomero district (77%) followed by Kilombero district (73%), Morogoro Urban district (70%), Morogoro Rural (68%), Kilosa (67%) and Ulanga (66%) (Chart 3.4)

Literacy Rates for Heads of Households

The literacy rate for the heads of households in the region was 77 percent. The literacy rates among the male and female heads of households were 78 and 73 percent respectively. Male head of household literacy rate was higher than that of female heads in all districts. The districts with the highest literacy rate amongst heads of households were Kilombero and Ulanga districts with each having a literacy rate of (82%) followed by Mvomero (77%), Morogoro Rural (76%), Kilosa (72%) and Morogoro Urban (70%) (Chart 3.5)

Educational Status

Information on educational status was collected from individual agricultural households members. The results show that 45 percent of the population aged 5 years and above in agricultural households in the region had completed different levels of education and 26 percent were still attending school. Those who have never attended school were 28 percent (Chart 3.6).

Agricultural households in Mvomero district had the highest percentage (48%) of population aged 5 years and above who had completed different levels of education. This was followed by Morogoro Urban and Kilombero districts each having 47% then Kilosa 46%, Ulanga 43% and Morogoro rural 42%.

The number of heads of agricultural households with formal education in Morogoro region was 196247 (75%), those without formal education were 64,498 (25%). The majority of heads of agricultural households (72%) had primary level education whereas less than 0.2 percent had post primary education (chart 3.8).

With regard to the heads of agricultural households with primary or secondary education in Morogoro region, Kilosa district had the highest percentage (26%) followed by Kilombero and Mvomero each having 20 percent then Morogoro rural 19 percent, Ulanga 13 percent and last was Morogoro Urban one percent. As for secondary education Kilombero had 30 percent followed by Ulanga 24 percent, Kilosa 19 percent, Morogoro Rural 15 percent, Mvomero 10 percent and Morogoro urban 6 percent. (Chart 3.8).

3.1.6 Off-farm Income

Off-farm income refers to cash generated from non-agricultural activities. This can be either from permanent employment (i.e., government, private sector or other), temporary employment or labourers. It also includes cash generated from working on farms belonging to other farmers. Off-farm income is important amongst agriculture households in Morogoro with 94 percent of households having at least one member with off-farm income. In Morogoro region 139,109 households had each one member age five years and above involved in off-farm income generating activity (53%), 79,217 households had each two members involved in off-farm income generating activities (30%) and 28,027 households had each more than two members involved in off-farm income generating activities (11%) and 14,393 households had each no member involved in off farm income generating activities (6%).

Ulanga district had the highest percentage of agriculture households with off-farm income (over 98.5% of total agriculture

households in the district). Other districts with high percent of agriculture households with off-farm income were Mvomero (98%), Morogoro Urban (98%), Kilosa (95%), Kilombero (94%) and Morogoro Rural (88%). The district with the highest percent of agriculture households with more than one member with off-farm income was Kilosa (48%). Morogoro district had the least number of households with more than one member having off-farm income (35%).

3.2 Crop Production

3.2.1 Land Use

Land area and planted area are two different types of area measurements. Land area refers to the physical area of land and is the same regardless of the number of crops planted on the land in one year. Planted area is the total area of crops planted in a year and the area is summed if there were more than one crop on the same land per year. A number of terms are used in this section which requires defining for clarification as follows:

Land Available refers to the area of land that has been allocated to smallholders through customary law, official title or other forms of ownership. Land available does NOT mean the total area of land that is designated as agriculture land in the country; however it is the land that is available to smallholders given the location of villages and lack of access to more remote parcels of unused agriculture designated land.

Usable land refers to the available land minus the land that cannot be used e.g. bare rock, shallow soils, steep slopes, swamp areas etc. It does however include un-cleared bush, Utilised land refers to the land that was used during the year.

3.2.1.1 Area of Land Utilised

The total area of land available to smallholders was 558,133 ha. The Regional average land area utilised for agriculture per household was only 1.8 ha. This figure is below the national average which is estimated at 2.0 hectares.

Land area utilised per household in five districts were below the national average with exception of Kilombero district which had the national average of 2.0 ha. It was followed by Mvomero 1.9ha,

Ulanga 1.8ha, Kilosa 1.8ha, Morogoro Rural 1.6ha and Morogoro Urban 1.5ha. The percentage utilized of the usable land per household is highest in Morogoro Rural (90%) and lowest in Kilombero (78%). Eighty four percent of the total land

available to smallholders was utilised. Only 12.5 percent of usable land available to smallholders was not used (Chart 3.11 and Map 3.7).

3.2.1.2 Types of Land Use

The area of land under temporary mono crop was 328,994 hectares (57.9% of the total land available to smallholders in Morogoro), followed by area of uncultivated usable land (83,452ha, 14.7%), temporary mixed crops (54,759ha, 9.6%), area under permanent mono crops (27,285ha, 4.8%), area under permanent/ annual mix (18,491ha, 3.3%), area under fallow (12,208ha, 2.2%), area rented to others (11,497 ha, 2.0%), area under permanent mixed crops (11,388ha, 2.0%), area unusable (9,659ha, 1.7%), area under natural bush (4,299ha, 0.8%), area under planted trees (2,891ha, 0.5%) and area under pasture (2,868ha, 0.5%). (Chart 3.12)

3.2.2 Annual Crops and Vegetable Production

Morogoro region has two rainy seasons, namely the short rainy season (October to November) and the long rainy season (April to May). The quantity of crops produced in both seasons will be used as a base for comparison with the past surveys and censuses.

3.2.2.1 Area Planted

The area planted with annual crops and vegetables was 428,534 hectares out of which 160,820 hectares (38%) were planted during short rainy season and 267,713 hectares (62%) during long rainy season. The average areas planted per household during the short and long rainy seasons was 0.6 and 0.7 ha respectively (Chart 3.13). The districts with the largest area planted per household (the average of the two seasons) were Kilombero (0.8 ha) followed by Ulanga and Mvomero district each having 0.7 ha. The district with the smallest average area planted was Morogoro Urban (0.4ha). The average planted area in all the district was higher in long rainy season than in short rainy season. (Chart 3.14 and Map 3.8)

The planted area occupied by cereals was 337,461 ha (81.5% of the total area planted with annuals). This

was followed by pulses (28,556 hectares, 6.9%), roots and tubers (22,301 hectares, 5.4%), oil seeds (12,735 hectares, 3.1%) fruit and vegetables (12,400 hectares, 3.0%) and cash crops (698 hectares, 0.2%).

The average area planted per household during the long rainy season in Morogoro region was 0.7 hectares. Almost all districts had an average of less than one hectare per household in that season. The district with the largest planted area per household was Kilombero 0.9ha followed by Kilosa and Mvomero each having 0.7ha, Ulanga 0.6ha, Morogoro Rural 0.5ha and the least was Morogoro Urban 0.4ha. (Chart 3.15 and Map 3.9)

Analysis of the Most Important Crops

Results on crop production are presented in two different sections. The first section compares the importance of each crop regardless of whether they are annual or permanent. The second section contains a more detailed analysis on production based on crop types.

3.2.2.2 Crop Importance

Maize is the dominant annual crop grown in Morogoro region and it had a planted area 1.5 times greater than paddy, which had the second largest planted area. The area planted with maize constitutes 47 percent of the total area planted with annual crops in the region. Other crops in order of their importance (based on area planted) are beans, cassava, Irish potatoes, cowpeas, paddy and tomatoes (Chart 3.16) Households that grow paddy, maize, carrot and bulrush millets have larger planted areas per household than for other crops (Chart 3.17a)

3.2.2.3 Crop Types

Cereals are the main crops grown in Morogoro region. The area planted with cereals was 337,461 ha (81.5% of the total planted area for annuals), followed by pulses with 28,556 ha (6.9%), roots and tubers 22,301 ha (5.4%), oil seeds and oil nuts 12,735 ha (3.1%) and fruits and vegetables 12,400 ha (3.0%). Annual cash crops which are mainly constituted of cotton and tobacco had the least planted area of about 698 ha (0.2%) (Chart 3.17b)

Cereals are the dominant crops grown in both seasons followed by pulses and other crop types are of minor importance in

3.3.4.1 Maize

Maize dominates the production of cereal crops in the region. The number of households growing maize in Morogoro region during the long rainy season was 148,561 (66% of the total crop growing households in the region during the long rainy season). The total production of maize was 115,570 tonnes from a planted area of 195,090 hectares resulting in a yield of 0.6 t/ha.

Chart 3.20 indicates maize production trend (in thousand metric tons) for the combined long and short rainy seasons. The production was steadily increasing from 70,000 tons in 1994/95 to 116,000 tons in 2002/03. The peak maize production was recorded in 1999/2000 with 152,000 tons. The average area planted with maize per household was 0.8 hectares; however it ranged from 0.5 hectares in Kilombero district to 1.0 hectares in Morogoro rural district. Morogoro rural district had the largest area of maize (137,106 ha) followed by Kilosa (72,420 ha), Kilombero (49,324 ha), Ulanga (29,884 ha), Morogoro urban (24,798 ha), and Mvomero (5,081 ha) (Chart 3.21 and Map 3.11).

Charts 3.20 and 3.22 show that, whilst the yield of maize has dropped over the previous 10 years, the quantity produced has increased and this has been due to a large increase in the area under production. The area planted with maize increased from 1994/95 to 2002/03. The peak area recorded under maize production was in 1999/00 (242,544 ha). However, the yield of maize has shown a gradual decline over the years since 1994/95 (from 2.1t/ha in 1994/95 to 0.6 t/ha in 2003) (Chart 3.22) (Map 3.12).

3.3.4.2 Paddy

Paddy is the second most important cereal crop in the region in terms of planted area. The number of households that grew paddy in Morogoro region during the long rainy season was 109,655. This represents 49 percent of the total crop growing households in Morogoro region in the long rainy season. The total production of paddy was 113,003 tonnes from a planted area of 126,527 hectares resulting in a yield of 0.89 t/ha.

The district with the largest area planted with Paddy was Kilombero (53,096 ha) followed by Ulanga (30,662ha), Kilosa (15,910 ha), Mvomero (13,360 ha), Morogoro rural (13,001 ha), and Morogoro urban (497ha) (Map 3.13). There were significant variations in the average area planted per crop growing household among the districts ranging from 0.4 ha in Morogoro urban to 1.2 ha in Kilombero and Ulanga districts (Chart 3.23 and Map 3.14).

The area planted with beans was larger than any other pulse crop and it was the most important crop in Morogoro in terms of planted area (5% of the total area planted with annual crops and vegetables) and it accounted for 71.5 percent of the area planted with pulses. The area planted with pulses during the long rainy season was 61% with beans having 70.2 percent of its production in the long rainy season. Other pulse crops were mainly produced during long rainy season with cowpeas 56.2 %, field peas 39.0% (which is mainly grown in short rainy season), green gram 67.8% and bambara nuts 100%. Mung beans and chick peas were grown during the short rainy season. The estimated yield was high for field peas 0.86t/ha, mung beans 0.5t/ha, beans 0.42t/ha, cowpeas 0.32t/ha, green peas .18t/ha, bambaranuts .15t/ha and chick peas 0.11t/ha.

3.3.5.1 Beans

The number of households growing beans in the region was 44,718 which represents 17 percent of the total crop growing households in the region. The total production of beans during the census year was 8,617 tons. The area planted with beans increased sharply from 6,363 ha to 25,500 ha over the period 1994 to 1999. Then the area planted with beans dropped to 20,407 in 2003.

Mvomero district had the largest planted area of beans (9,422 ha, 46.2% of total area planted area for annual crops in the district), followed by Kilosa (7,813 ha, 38.3%), Ulanga (1,569 ha, 7.7%), Morogoro rural (1,262 ha, 6.2%), Morogoro urban (267 ha, 1.3%), and Kilombero (74 ha, 0.4%). However, the highest proportion of land planted with beans, expressed as a percent of the total land area was in Mvomero district (10.6%). This was followed by Kilosa (6.9%), Morogoro Urban (5.4%), Ulanga (2.9%), Morogoro Rural (1.7%), and Kilombero (0.1%) (Chart 3.29 and Map 3.15).

The total production of oil seeds and nuts was 4,167 tons. Out of which simsim were dominant at 2,752 accounted for 66 percent of the total production of oil seeds and nuts followed by groundnuts (28%), sunflower (3.2%), castor seed (2.8%) and soyabeans (0.3).

3.3.7.1 Simsim

The number of household growing simsim in Morogoro region was 16,162 ha. The total production of simsim in the region was 2,170 tonnes from a planted area of 7,362 hectares resulting in a yield of 0.3 t/ha.

More than forty nine percent of the area planted with simsim was located in Morogoro Rural District (4,712 ha) followed by Kilosa (4,223 ha' 44.45), Ulanga (312 ha, 3.2%), Mvomero (222 ha, 2.3%), Morogoro Urban (37.5 ha, 0.4%) and Kilombero (13 ha, 0.1%) (Chart 3.35 and Map 3.21)

The largest area planted per simsim growing household was found in Morogoro Urban district (0.58 ha) and the lowest was Kilombero (0.1 ha) The range between the district with the highest and lowest area planted per household depicts small variations in area planted among the districts (Chart 3.36 and Map 3.22)

3.3.8 Fruits and Vegetables

The collection of fruits and vegetables production data was difficult due to the small quantities produced per household. Most of the data presented here gives the production of smallholders who grew these crops as cash crops and not merely for household consumption. Most fruit production is from perennial crops and only water melon is reported as an annual crop in this section.

The long rainy season is relatively important for fruits and vegetables production since 58% of the total area planted with fruits and vegetables was during the long rainy season. For onions, cabbage, amaranths and pumpkins over 60 percent of the planted area for each crop was during the long rainy season. The planted area for carrot in the short rainy season was over 90 percent of the total planted area during the survey year. Reliable historical data for time series analysis of fruits and vegetables were not available.

The total area planted with tomatoes accounted for 1.5 percent of the total area planted with annual crops and vegetables during the short and long rainy seasons.

3.3.8.2 Cabbage

The number of households growing cabbages in the region during the long rainy season was 3,588 and 1,883 in the short rainy season. This represented 0.56 percent of the total crop growing households in the region in the long rainy season and 0.29 percent in the short rainy season.

Mvomero district had the largest planted area of cabbage (1,371 ha, 72.6% of the total area planted with cabbage in the region), followed by Kilosa (237 ha, 12.5%), Morogoro Rural (133 ha, 7.1%), Ulanga (91 ha, 4.8%), Morogoro Urban (38 ha, 2.0%) and Kilombero (19 ha, 1.0%) districts (Chart 3.40).

The total area planted with cabbages accounted for 0.3 percent of the total area planted with annual crops and vegetables during the short and long rainy seasons.

3.3.8.3 Carrots

The number of households growing carrots in the region during the long rainy season was 160 households and 623 in the short rainy season. This represented 0.02 percent of the total crop growing households in the region in the long rainy season and 0.10 percent in the short rainy season.

Mvomero district had the largest planted area of carrots (398 ha, 83.2% of the total area planted with carrots in the region), followed by Morogoro Rural (74 ha, 15.6%), Morogoro Urban (5 ha, 1.1%). Other districts of Kilosa, Kilombero and Ulanga reported no carrot production (Chart 3.41)

The largest proportion of the area planted with carrots was found in Mvomero district (0.45%), followed by Morogoro Urban (0.11%), Morogoro Rural (0.1%), the remaining districts of Kilosa, Kilombero and Ulanga reported no area planted with carrots.

The total area planted with carrots accounted for 0.07 percent of the total area planted with annual crops and vegetables during the short and long rainy seasons.

3.3.9 Other Annual Crops Production

Most of the other annual crops can be defined as cash crops, however it is difficult to distinguish between cash crops and other crops given that many of the food crops are also used for generating income. During the 2002/03 agriculture year an area of 698 ha was planted with other crops and of this cotton was the most prominent followed by tobacco.

The area planted with annual cash crops in short rainy season was 16 ha which represented 2.3 percent of the total area planted with other annual cash crops in short and long rainy season.

3.3.9.1 Cotton

The quantity of cotton produced was 248 tonnes. Cotton had a planted area of 620 ha and it was produced during the long rainy season only (Chart 3.42). The crop is mainly grown in Kilosa, Ulanga and Mvomero districts.

3.3.9.2 Tobacco

The quantity of tobacco produced was 38 tonnes. Tobacco had a planted area of 78 ha, most of which was planted in the long rainy season. Tobacco production is concentrated in 2 districts with Morogoro Rural having the largest area planted with this crop (79%) and Ulanga (21%) (Chart 3.43)

3.4 Perennial Crops

Perennial crops (sometimes referred as permanent crops) are crops that normally take over a year to mature and once mature can be harvest for a number of years. For most crops it is easy to determine if they are annual or perennial.

However, for crops like cassava and bananas the distinction is not so clear. Cassava has varieties that mature within a year and produces only one harvest, whilst other varieties survive for more than one year and produces several harvests. In this census cassava was treated as an annual crop.

Bananas normally take less than a year to mature and produce a harvest and survive for more than one year. In the census bananas are treated as perennial crops. In this report the agriculture census results are presented for the most important perennial crop in terms of production, yield and area planted. Previous censuses and surveys did not measure these variables for perennials, therefore no time series data in this section.

The area of smallholders planted with perennial crops was estimated at 50,712 hectares equivalent to 11 percent of the area planted with annual and perennial crops in the region. The most important perennial crop is bananas which accounts for 19% of the total area planted with perennial crops followed by sugar canes (16%), coconuts (15%) and mango (10.5%) (Chart 3.45).

However, the area planted with annual crops is not the actual physical land area as it includes the area planted more than once on the same land, whilst for the planted area for perennial crops is the same as physical planted land area. So the percentage physical area planted with perennial crops would be higher than indicated in Chart 3.44

Bananas had the highest smallholder planted area (9,396 ha, 19%) of all permanent crops followed by sugarcane (8,330 ha, 16%), coconut (7,550 ha, 15%), mango (5,302 ha, 10.5%) and orange (4,549 ha, 9%). Each of the remaining permanent crops had an area of less than 5% of the total area planted with permanent crops.

Morogoro Rural district had the largest area under smallholder permanent crops (17,368 ha, 34%). This is followed by Mvomero (13,773 ha, 27%), Kilosa (9,604 ha, 19%), Kilombero (6,360 ha, 12%), Ulanga (2,125 ha, 4%) and Morogoro Urban (1,749 ha, 3%). In terms of area of

Table 3.7: Area, Production and Yield of Annual Cash Crops by Season

Crop	Short Rainy Season			Long Rainy Season			Total		
	Area Planted (ha)	Quantity Harvested (tons)	Yield (t/ha)	Area in Hectare	Quantity harvested (tons)	Yield (t/ha)	Area in Hectare	Quantity harvested (tons)	Yield (t/ha)
Cotton	0	0	0.0	620	248	0.4	620	248	0.4
Tobacco	16	2	0.1	62	35	0.6	78	38	0.5
Total	16	2	0.1	682	283	0.4	698	285	0.4

permanent crops planted per household Ulanga had the largest area (0.50 ha) followed by Mvomero (0.28 ha), Morogoro Rural (0.25 ha), Morogoro Urban (0.24 ha), Kilombero (0.22 ha) and Kilosa (0.18% ha). However, in terms of area of permanent crops planted expressed as a percentage of the total area planted with crops per district, Morogoro Urban had the highest (26%) followed by Morogoro Rural (19%), Mvomero (13%), Kilosa (8%), Kilombero (7%) and Ulanga (4%) (Chart 3.46)

3.4.1 Banana

The total production of bananas by smallholders was 47,415 tonnes. In terms of area planted, banana was the most important permanent crop grown by smallholders in the region. It was grown by 30,480 households (22% of the total crop growing households). The average area planted with banana per household was relatively small at around 0.3 ha per banana growing household and the average yield obtained by smallholders was 5310 kg /ha from a harvest area of 8,928 hectares.

Morogoro Rural had the largest area of banana in the region (2,722 ha, 29%) followed by Kilosa (1,961 ha, 21%), Kilombero (1,330 ha, 14%), Mvomero (1,256 ha, 13%), Morogoro Urban (1,177 ha, 13 and Ulanga (950 ha, 10%). The average area planted with banana per banana planting household was highest in Morogoro Urban (0.63 ha) followed by Morogoro Rural (0.32 ha), Kilombero (0.31 ha), Mvomero (0.30 ha), Ulanga (0.27 ha) and Kilosa (0.24 ha) (Chart 3.47)

3.4.2 Sugarcane

The total production of sugarcane by smallholders was 213,556 tonnes. In terms of area planted, sugarcane was the second most important permanent crop grown by smallholders in the region. It was grown by 9,463 households (6.9% of the total crop growing households). The average area planted with sugarcane per household was 0.9 ha per sugarcane growing household and the average yield obtained by smallholders was 28,798 kg /ha from a harvest area of 7,416 hectares.(Map 3.25)

Mvomero had the largest area of sugarcane in the region (2,795 ha, 33.6%) followed by Kilosa (2,588 ha, 31.1%), Kilombero (2,573 ha, 30.9%), Morogoro Rural (199 ha, 2.4%), Ulanga (118 ha, 1.4%) and Morogoro Urban (56 ha, 0.7%). However, the average area planted with sugarcane per sugarcane planting household was highest in Mvomero (1.2 ha) followed by Kilombero (1.0 ha), Kilosa (0.8 ha), Morogoro Rural (0.6 ha), Morogoro Urban (0.2 ha) and Ulanga (0.1 ha) (Chart 3.48 and Map 3.26)

3.4.3 Coconut

The total production of coconut by smallholders was 7,550 tonnes. In terms of area planted, coconut was the third most important permanent crop grown by smallholders in the region. It was grown by 23,954 households (17% of the total crop growing households). The average area planted with coconut per household was relatively small at around 0.32 ha per coconut

growing household and the average yield obtained by smallholders was 6,534 kg /ha from a harvested area of 2,749 hectares.

Morogoro Rural had the largest area of coconut in the region (5,086 ha, 67%) followed by Kilosa (1,397 ha, 19%), Mvomero (498 ha, 7%), Kilombero (296 ha, 4%), Ulanga (246 ha, 3%), Morogoro Urban (27 ha, 0.4%).

However, the area planted with coconut per coconut growing household was highest in Morogoro Rural (0.46 ha), followed by Kilosa (0.34 ha), Mvomero (0.15 ha), Morogoro Urban (0.15 ha), Ulanga (0.13 ha) and Kilombero (0.09 ha) (Chart 3.49).

3.4.4 Mango

The total production of Cashew nuts by smallholders was 49,490 tonnes. In terms of area planted, mango was the fourth most important permanent crop grown by smallholders in the region. It was grown by 21,979 households (16% of the total crop growing households). The average area planted with mango per household was relatively small at around 0.24 ha per mango

growing household and the average yield obtained by smallholders was 19713 kg /ha from a harvest area of 2,511 hectares.(Map 3.27)

Mvomero has the largest area of mango in the region (1,983 ha, 37%) followed by Kilosa (1,433 ha, 27%), Morogoro Rural (889 ha, 17%), Kilombero (615 ha, 12%), Ulanga (319 ha, 6%) and Morogoro Urban (64 ha, 1%). However, the average area planted per mango planting household was highest in Mvomero (0.40 ha), followed by Kilosa (0.24 ha), Morogoro Rural (0.20 ha), Kilombero (0.17 ha), Ulanga (0.13 ha) and Morogoro Urban (0.11 ha) (Chart 3.50 and Map 3.28)

Though ox-ploughing is the most recommended tillage method for the Tanzanian small holder farmers in Morogoro region tractor ploughing is commonly used than oxen ploughing. Kilombero district is leading in practicing this technology having cultivated 17,246 (33%) hectares followed by Mvomero 13,535 (26%) hectares, Kilosa 11,541 (22%), Ulunga 7,543 (14%) hectares, Morogoro Rural 2,343 (4%) hectares and Morogoro Urban 340 (1%) hectares.

During the long rainy season, 82.5 percent of the total area cultivated by using oxen was planted with cereals followed by oil seed 9.5percent, pulses 3.9 percent, fruits and vegetables 1.9 percent, roots and tuber 1.7 percent and cash crops 0.6 percent.

3.5.3 Improved seeds use

The planted area using improved seeds was estimated at 55,330 ha which represents 14% of the total planted with the annual crops and vegetables area. The percentage use of improved seed in the long rainy season at (14.1%) was slightly higher than the corresponding percentage use for the short rainy season (13.6%).

Cereals had the largest planted area with improved seeds (44,355 ha, 80.2%) followed by fruit and vegetables (7,390 ha, 13.4%), pulses (2,087 ha, 3.8%), oilseed and oil nuts (800 ha, 1.4%), Cash crops (441 ha, 0.8%) and roots and tubers (257 ha, 0.5%) (chart 3.54). However the use of improved seed in cash crops and fruits and vegetables is much greater than in other crop types (63% and 60% respectively), only 4% of the planted area for roots and tubers used improved seed (Chart 3.55b).

3.5.4.1 Farm yard manure use

The number of households that applied farm yard manure in their annual crops during the long rainy season was 7,480 and it was applied to 9,126 ha representing 3% of the total area planted during that season (Table 3.9). The largest proportion of area applied with farm yard manure was on pulses (78%), followed by cereals (37%), fruits and vegetables (33%), roots and tubers (27%) and oil seeds (21%). In the region farm yard manure was not applied in cash crops. However, the largest area applied with farm yard manure was found in cereals (6,750 ha, 75%) followed by fruits and vegetables (1,205 ha, 13%), pulses (1,000 ha, 11%), the use farm yard manure in oil seeds and cash crops was negligible (Chart 3.58 and 3.59a and Map 3.29)

Farm yard manure is mostly used in Kilombero (8.0% of the total planted area in the district), followed by Mvomero (5.2%), Ulanga (5.0%), Morogoro Urban (3.8%), Morogoro Urban (2.5%) and Kilosa (0.6%). The results indicate the absence of clear relationship between the number of cattle in the district and the use of farm yard manure (Chart 3.59b)(Map 3.30)

For permanent crops, most farm yard manure is used for the production of bananas (35%), followed by mango (17%), coconut (16%), sugarcane (10%), orange (9%), other crops pawpaw, palm oil, pineapple, mandarin and cashew nut comprise (13%).

3.5.4.2 Inorganic Fertiliser Use

The number of households that applied inorganic fertilizer on their annual crops during the long rainy season was 8,584 and it was applied to 13,448 ha representing 4.7% of the total area planted during that season (Table 3.9). The largest area applied with inorganic fertilizers was on cereals

(72% of the total area applied with inorganic fertilizers), followed by fruits and vegetables (27%) and pulses (1%) (Chart 3.60) However, the proportion of fruit and vegetables with inorganic fertilizers was at (36%) higher than other crop types, followed by cereals (2.9%) and Pulses (0.6%). Inorganic fertiliser is mostly used in Mvomero district (9.7% of the total planted area in the district), followed by Morogoro Urban (1.6%). Other districts used small quantities of inorganic fertiliser and Morogoro Rural recorded the lowest proportion use of inorganic fertiliser (0.1%)(Map 3.31).

In perennial crops inorganic fertiliser were used on sugar cane (80.6%), followed by mango (11.4%), pineapple (4.2%) and coconut (3.8%).

3.5.4.3 Compost Use

The number of households that applied compost manure on their annual crops during the long rainy season were 3,803 and it was applied to 4,161 ha representing 1.6% of the total area planted (Table 3.9). The proportion of area applied with compost was very low for each type of crop (0 to 4%); however the distribution of the total area using compost manure shows that 83% of this area was cultivated with cereals, followed by fruits and vegetables (7%), oil seeds (7%) pulses (2%) and roots and tubers (1%)(Chart 3.62)(Map 3.30).

In permanent crop, compost was mostly used in coconut (29.3%) followed by mango (18.3%), banana (17.6%), sugarcane (12.7%), orange (7.8%), palm oil (6.1%), coffee (3.7%), pineapple (3.5%), cashew nut and lemon each having (0.4%).

3.3.4.5 Pesticide Use

Pesticides are chemicals used for controlling insects, diseases and weeds. This section analyses the use of these chemicals by smallholders on both annual and perennial crops in the region. Pesticides were applied to 35,902 ha of annual crops and vegetables.

Insecticides are the most common pesticide used in the region (44% of the total area applied with pesticides).

This was followed by herbicides (39%) and fungicides (17%) (Chart 3.64a)

Insecticide use

The planted area applied with insecticides was estimated at 35,902 ha which represented 9% of the total planted area for

annual crops and vegetables. Cereals had the largest planted area applied with pesticide (22,552 ha, 57.2%) followed by fruits and vegetables (21,133 ha, 30.5%), pulses (2,021 ha, 9%), cash crops (501 ha, 2.2%), oil seeds (175 ha, 0.8%) and roots and tubers (65 ha, 0.3%) (Chart 3.65)

However the percent of insecticides used in cash crops and fruits and vegetables is much greater than in other crop types being 72% and 56% respectively, while only 0.3% of root and tuber crops were applied with insecticides (Chart 3.65).

Annual Crops with more than 50% insecticide use were onions (100%), cabbage (86.2%), cucumber (82.5%), cotton (80.8%), chillies (65.3%), spinach (61.2%) tomatoes (60.1%) and carrots (55.3%).

Mvomero had the highest percent of planted area with insecticide (13.4% of the total planted area with annual crops in the district). This was closely followed by Ulanga (11.8%) then Kilombero (7.4%), Kilosa (3.4%) and Morogoro Urban (3.1%). The smallest percentage use was recorded in Morogoro Rural district (1.2%) (Chart 3.66)

3.5.5.2 Herbicide Use

The planted area applied with herbicides was estimated at 37,867 ha which represented 7.8% of the total area planted with annual crops and vegetables. Cereals had the largest planted area applied with herbicides (36,657 ha, 97%) followed by oil seed (900 ha, 2.4%), pulses (217 ha, 0.6%) and fruits and vegetables (93 ha, 0.2%). Herbicides were not applied in cash crops and in roots and tubers (Chart 3.67).

However the percent of herbicide use in oil seed was much greater than in other crop types being 16.1% followed by cereals (8.1%), pulses (2.1%) and fruits and vegetables (1.1%) (Chart 3.68).

The top six annual crops with highest percentage use of herbicides in terms of area were paddy (27%), onion (16%), egg plant (16%), tomatoes (10%), cucumber (8%) and cabbage (6%).

The highest proportion of the planted area applied with herbicides was found in Kilombero district (19%) followed by Ulanga (18.9%), Mvomero (3.7%), Kilosa (2.3%), Morogoro Urban (2.1%) and Morogoro Rural (0.3%) (Chart 3.69).

3.5.5.3 Fungicide Use

The planted area applied with fungicides was estimated at 14,180 ha which represented 3% of the total planted area for annual crops and vegetables. The percentage use of fungicides in the long rainy season at (4%) was higher than the corresponding percentage for the short rainy season (2%). Fruits and vegetables had the largest planted area applied with fungicides (4,808 ha, 55%) followed by cereals (3,624 ha, 41%), pulses (318 ha, 4%) and roots and tubers (9 ha, 0.1%). Fungicides were not used in cash crops and oil seeds (Chart 3.70).

However the percentage use of fungicide in fruits and vegetables was much greater than in other crop types being 38% followed by pulses (1.1%), cereals (1.07%) and roots and tubers (0.4%). (Chart 3.71).

Annual crops with more than 40% fungicide use were tomatoes (56%), cucumbers (50%), onions (49%) and spinach (40%).

Kilosa, Morogoro Urban and Mvomero districts reported higher percentage use of fungicides with application to 5.8, 5.5 and 5.3 percent respectively of the total area planted while Morogoro Rural, Ulanga and Kilombero districts recorded the lowest percentage use of 1.9, 1.4 and 0.7 percent respectively (Chart 3.72).

3.5.6 Harvesting methods

The main harvesting method for cereals was reported to be by hand. All cereals planted during the agricultural year 2002/03 (except maize and paddy) were harvested by hand. It is estimated that 89.6 percent of the total area planted with maize was harvested by hand whereas 0.1 percent was harvested by draft animals and 0.1 percent was harvested by machines. For paddy, 84.7 percent of the total area planted was harvested by hand, whereas 0.4 percent was harvested by machine. The rest of the annual crops and vegetables were harvested by hand.

3.5.7 Threshing methods

Hand threshing was the most common method used, out of the total area planted 86 percent of the total area planted with cereals during the long rain season of the agricultural year 2002/03 was threshed by hand. The crops that were threshed by draft animals, human powered tools and engine driven machines were harvested from 0.1%, 0.2% and 0.6% of the total area respectively. Cereals harvested from 13% of the total planted area were not threshed.

3.6 Irrigation

Water is the limiting factor to crop production in the majority of areas in Tanzania and without water most other agricultural practices applied to crops do not result in significant increases in yields. This section deals with the area under irrigation for different crops and the means by which water was extracted from the source and applied to the field.

3.3.5.1 Area planted with annual crops and under irrigation

In Morogoro region the area of annual crops and vegetables under irrigation was 64,685 ha representing 16 percent of the total area planted. The area under irrigation during the short rainy season was 6,810 ha accounting for 11 percent of the total area under irrigation in agricultural year 2002/03. However the percentage of the planted area under irrigation during the long rainy season was 20% compared with 5% in the short rainy season. Some crops, especially vegetables, were predominantly grown in the short rainy season with irrigation. In the short rainy season 62% of the area planted with vegetables was irrigated, whilst 56% of the vegetables were irrigated in the long rainy season.

The district with the largest planted area under irrigation for annual crops were Mvomero (17,481 ha, 27% of the total planted area with irrigation) and Kilosa (17,255 ha, 26.7%). When expressed as a percentage of the total area planted, Morogoro Urban (32%) and Mvomero (20%) had proportionally more planted area with irrigation than other districts, followed by Morogoro Rural (19%), Kilosa (15%), Kilombero (11%) and Ulanga (10.7%) (Chart 3.74)(Map 3.32)

Of all the different crops and in terms of proportion of the irrigated planted area, watermelon (99.7%), onions (88%), cabbage (80%), chillies (73.8%) and spinach (73.1%).

In terms of crop type, the area under irrigation for roots and tubers was 14,756 ha (46% of the total area under irrigation), followed by cereals with 8,162 ha (26%), fruits and vegetables 7,255 (23%) and pulses 1,552 (5%) . All of the irrigation on cereals was applied to maize and paddy.

The area of fruits and vegetables under irrigation was estimated at 7,255 ha which represented 59% of the total planted area with fruits and vegetables. Watermelon, onions and cabbage were the most irrigated crops. Irrigation was not used in annual cash crops.

3.6.2 Sources of water used for irrigation

The main sources of water used for irrigation were river (57% of households with irrigation), canal (26%) and wells (15%). Only 0.1 percent of the households used water from boreholes and the proportion of households that used pipe water as a source of water for irrigation was (2%). Dams as source of irrigation water were not used in the region.

It was estimated that 53 percent of households using irrigation as well as 28 of households using river as source of irrigation water in the region were from Kilosa and Mvomero districts respectively.

3.6.3 Methods of Obtaining Water for Irrigation

Gravity was the most common means of getting water for irrigation with 61% of households using this method. This was closely followed by hand bucket by 35% of households. The remaining methods (hand pump, motor pump and others) were of minor importance (Chart 3.76).

Gravity was used by most households with irrigation in Kilosa (49.7%), followed by Mvomero (32.5%), Kilombero (8%), Morogoro Rural (5.5%), Ulanga (2.9%) and Morogoro Urban (1.4%). Hand bucket was more common in Mvomero where 35.6% of households used this method to get water for irrigation, followed by Kilosa (24.4), Ulanga (18%), Morogoro Rural (10.9%), Kilombero (9.7%) and Morogoro Urban (1.3%).

3.6.4 Methods of Water Application

Most households used bucket/watering can (50% of households using irrigation). This was closely followed by hand jijnbucket/watering can (47%). Water horse and sprinkler were not widely used (2% and 1% respectively) (Chart 3.77)

Although the method of obtaining irrigation water by hand bucket was very common in all six districts, motor pump as a method of obtaining water for irrigation was practiced in Kilosa and Mvomero district and hand motor was used in Kilosa District.

3.7 Crop Storage, Processing and Marketing

3.7.1 Crop Storage

Crop storage means keeping the crop for a certain period of time for various reasons. These reasons include storing the crops for food for the household, storing the crops in order to sell it later at higher prices and storing the crops as seed for planting in the following season.

The results for Morogoro region show that there were 336,432 crop growing households (15.3% of the total crop growing households) that reported storing various agricultural products in the region.

The most important stored crop in terms of quantity was paddy with 99,430 households storing 19,870 tonnes as of 1st Januari 2004. This was followed by maize (183,248 households and 17,805 tonnes), sorghum and millets (15,471 households and 1,436 tonnes) and beans and pulses (35,134 households and 955 tonnes) and groundnuts (1,524 household and 154 tonnes). The rest of the crops were stored in very small amounts (Chart 3.78)

3.7.1.1 Methods of Storage

The region had 145,569 farming households storing their produce in sacks/open drum structures. This number is equivalent to 66.7 percent of households that stored crops. The households that stored their produce in locally made structures were estimated at 61,762 (28.3%). The number of households that used other methods of storage and their relative proportions were as follow: improved locally made structures 4,577 (2.1%), air tight drum structures 2,619 (1.2%), unprotected pile 1,670 (0.8%) and modern store 385 (0.2%). Those who stored in structure other than those mentioned above were estimated at 1,659 (0.8%) (Chart 3.79)

Sack/open drum structures were the dominating storage method in all districts. It was mostly used by households in Kilombero (82% of the total number of households storing crop products), followed by Kilosa households (76%), Morogoro Urban households (66%), Ulanga households (65%), Morogoro Rural (52%) and Mvomero (51.8%) (Chart 3.80).

Locally made traditional structures were mostly used by households living in Mvomero (43.9% of the total number of households storing crop products), followed Morogoro Rural (40.5%), Ulanga (26.6%), Morogoro Urban (21.5%), Kilosa (20.5%) and Kilombero (14.7%).

3.7.1.2 Duration of storage

Most of the households (54% of the households storing crops) stored their produce for the period of three to six months followed by those who stored for the period of more than six months (30%). The minority (16%) are those who stored their crop produce for the period of less than three months.

The storage pattern for beans and pulses indicated that most households were those storing for the period of between three and six months followed by over six months and the least number of household were those storing for the period of over less than three months (Chart 3.81). The proportion of households that store their produce for the duration of

three to six months was the highest in Morogoro Rural (66%) followed by Mvomero (65%), Ulanga (61%), Morogoro Urban (51%), Kilosa (51%) and Kilombero (32%) (Chart 3.82) (Map 3.33)

District comparison of duration of storage cannot be done for all crops combined. However, the analysis has been done for maize only as it is the most commonly stored crop. In general, quantity stored was related to the quantity produced. Districts with greater production had a higher percent of their crop stored as on 1st October 2003, however Mvomero district used proportionately more of the maize harvest than in some district with lower production indicating that the quantity stored was determined by the food and seed requirement of the household and not to sell during the “off-season” when the farm gate price of maize is higher.

3.7.1.3 Purposes of Storage

Basically, there are three major purposes of crop storage. These include storing crops for household consumption, seeds for planting and selling at higher prices.

Subsistence food crops (Maize, paddy, sorghum and millet, beans and pulses) are mainly stored for household consumption, with seed for planting being the second most important purpose. Practically all stored annual cash crops are stored for selling at higher price. Some of

the stored perennial cash crops are for household consumption and seeds for planting in the case of cashew nuts. The percent of households that stored maize for household consumption as the main purpose of storage is 84.1 percent. This is followed by seed for planting (14%) and selling at a higher price (2%) (Chart 3.83)

3.7.1.4 The Magnitude of Storage Loss

About 76 percent of households that stored crops had little or no loss but the proportion of households that reported experiencing a loss of more than a fourth or more is relatively high for foods crops than the crops that are produced for sale such as coffee, tobacco, cashew nut, groundnut and bambara nuts.

Table 3.10: Number of Households Storing Crops by Estimated Storage Loss and District

District	Estimate Storage Loss				Total
	Little or no Loss	Up to 1/4 Loss	Between 1/4 and 1/2 Loss	Over 1/2 Loss	
Kilosa	48098	8267	1562	1261	59188
Morogoro Rural	25084	13044	2784	607	41519
Kilombero	36186	7931	1698	0	45815
Ulanga	19676	6352	896	225	27149
M'goro Urban	2772	456	87	38	3353
Mvomero	34371	4179	1654	1014	41218
Total	166187	40229	8681	3145	218242

The proportion of households that reported a loss of more than one fourth for maize is the highest (6.2 of the total number of households that stored crops), followed by sorghum and millets (3.7%), paddy, beans and pulses (2.7%). It is estimated that 100 percent of the households that grew cash crops such as cashew nut, tobacco and annual crops such as groundnuts and bambara nuts reported little or no loss (Table 3.10)

3.7.2 Agro processing and by-products

Agro processing refers to an activity which converts crop product from one form to another form in order to add value or increase the palatability of the product. Agro processing could aim at producing products for household utilization or for sale. Agro-processing was practiced in most crop growing households in the region (232,139 households, 89% of the total crop growing households). The percent of households processing crops was very high in all districts (above 80%). (Chart 3.85)

3.7.2.1 Processing Methods

Most crop processing households processed their crops using a neighbour's machine representing 65.8 percent (152,655 households). This was followed by those processing on-farm by hand (61,677 households, 26%), on farm by machine (14,316, 6.2%) and trader (2,684, 1.2%). The remaining methods of processing were used by very few households (less than 1%).

However there were district differences with Kilosa, Kilombero, Mvomero and Ulanga having the highest percent of households processing by hand (26%, 24%, 20% and 14% respectively). All other districts processed mostly by

neighbours machines. Processing by trader was more common in Morogoro Urban and Mvomero districts (4.79 and 4.77) than in other districts. Processing on farm by machine was more prevalent in Morogoro Urban, Morogoro Rural and Ulanga than in other districts(Chart 3.86).

Main Agro-processing products

Two types of products are sometimes produced from agro-processing namely, main product and by-products. The main product is the major product after processing and the by-product is the secondary after processing. For example the main product after processing maize is normally flour whilst the by-product is normally the bran.

The main processed product produced by the largest number of crop growing households was flour/meal with 155,687 households (67%) followed by grain with 72,230 households (31%). The remaining products were produced by a small number of households (Chart 3.87).

The number of households producing by-products accounted for 84.8 percent of the households processing crops. The most common by-product produced by crop processing households was bran with 151,260 households (94%) followed by Husks (3,807 households, 2%), pulp (1,576, 1%) and cake (3,501, 2%). The remaining by-products were produced by a small number of households (Chart 3.88).

3.7.2.3 Main use of primary processed products:

The primary processed products were used for households or human consumption, fuel for cooking, for selling as well as animal consumption. Of all the uses, household/human consumption was leading as it represented about 97 percent of the total households that used primary processed product.

Mvomero, Kilombero and Morogoro Rural were the only districts which reported using the primary products as fuel for cooking.

Out of 2504 households that sold processed products, 1,938 were from Morogoro Rural (77.4% of the total number of households selling processed products in the region), followed by Ulanga with 296 households (11.8%), Kilosa with 131 households (5.2%), Mvomero with 127 households (5.1%), Morogoro Urban with 12 household (0.5 %) and none from Kilombero district. (Chart 3.89). However, the proportion of households that

sold processed products (based on the number of households that used the processed product) is highest in Ulanga (44.3%), followed by Kilombero (13.1), Morogoro Rural (8.9%), Mvomero (8.3%), Morogoro Urban (7.9%) and Kilosa (4.1%).

3.7.2.4 Outlets for Sale of Processed Products

The greatest number of households sold processed products to neighbours (9,722 households, 47% of households that sold crops). This was followed by selling to local market/trade store (4,089, 19%), trader at farm (2,760, 13%), Marketing co-operatives (217, 1%), large scale farm (207, 1%) and Farmers Associations (212, 1%) (Chart 3.91)

There are small differences between districts on crop processing households that sold processed produce to neighbours. The district differences were large for the rest of the sale outlets. In Kilombero, the sale of processed produce to farmer associations was prominent. The districts that had the highest proportion of farmers selling processed products to marketing cooperative were Ulanga and Kilosa.

The districts which had the highest percent of crop processing households selling to local markets or trade stores were Ulanga and Morogoro Rural. The percentage of households selling processed products to traders on farm was highest in Kilombero (51.4%), followed by Kilosa (23.5%), Ulanga (19.7%), Mvomero (3.1%) and Morogoro Urban (2.4%) (Chart 3.92). Morogoro Rural district reported no households selling processed products to traders at farm.

3.7.3 Crop Marketing

The number of households that reported selling crop was estimated at 182,902 which represent 70.1 percent of the total number of crop growing households. The percent of crop growing households selling crops was highest in Kilombero (87%) followed by Morogoro Urban (76%), Ulanga (74%), Morogoro Rural (69%), Mvomero (69%) and Kilosa (60%) (Chart 3.93 and Map 3.34).

3.7.3.1 Main Marketing Problems

Low price for agricultural produce was the main problem reported by households (73% of households). Apart from low market prices, other problems were longer distances to the markets (15%), transport cost too high (5%), no transport (4%), no buyer (1%) and lack of market information (1%). Other marketing problems are minor and represented less than 1% of the total reported problems.

3.8.1.2 Uses of agricultural credits

A big proportion (39%) of the agricultural credits provided to agricultural households in the region were used on hiring labour, (38%) were used on buying seeds, agro-chemicals (9%), fertilizers (6%). The proportion of credits intended to be used for tools, equipment, livestock and other were very low (Chart 3.96a).

3.8.1.3 Reasons for not using agricultural credits

The main reason for not using agricultural credit as a source of finance was little credit awareness accounting to 42 percent of the agricultural households this was followed by households reporting the un-aware of the credit (19%). The proportions of households whose reasons for not getting agricultural credits were “unavailability” and “not wanting to go into debt” were 18 and 9 percents respectively. The rest of the reasons were collectively mentioned by less than 5 percent of the households (Chart 3.96c).

3.8.2 Crop Extension

The number of Agricultural households that received crop extension was estimated at 67,368 or 26 percent of total crop growing households in the region (Chart 3.97). Some districts have more access to extension services than others. Ulunga had a relatively high proportion of households (37%) that received crop extension messages in the district followed by Mvomero (35%), Kilombero (32%), Kilosa (21%), Morogoro Rural (13%) and Morogoro Urban (10%) (Chart 3.98a and

Map 3.36).

3.8.2.1 Sources of crop extension messages

Of the households receiving extension advice the Government provided the greatest proportion (92.9%, 61,803 households), NGOs provide 3.5 percent, large scale farms 2.2 percent and the remaining providers less than 0.8 percent. However, district differences exist with the proportion of the households receiving advice from government services ranging between 86% and 97% in Morogoro Rural and Ulanga respectively.

3.8.2.2 Quality of Extension

The result on the assessment of extension quality indicates that 67 percent of the households receiving extension ranked the service as being good followed by average (17%), very good (14%), poor (2%) and no good (0.2%)(Chart 3.99).

However, care should be exercised when making decisions on quality of extension and also other variables in the extension report as all the enumerators were extension agents and some degree of bias is expected.

3.9 Access to Inputs

Access to inputs in this section refers to all crop growing households in Tanzania regardless of whether the household grew annual or permanent crops. In previous sections the reference was on annual crops only. Because of this, the figures presented in this section may be different from the previous section on inputs (Section 2.6). Data on source of inputs is only found in this section and it applies to both annual and permanent crops.

Type of Input	Households With Access to Input		Without Access to Input	
	Number	%	Number	%
Farm yard manure	14937	6	246809	94
Improved seeds	38684	15	221916	85
Pesticides/Fungicide	20823	8	239784	92
Inorganic fertiliser	17374	7	243137	93
Compost	7421	3	253448	97
Herbicide	20987	8	239278	92

A small number of households use inputs and the most applied input is improved seeds which were used by 38,684 households (15% of the total number of crop growing household). This is followed by household using pesticides/fungicide (8%), herbicides (8%), inorganic fertilizers (7%), farm yard manure (6%) and compost (3%) (Table 2.13).

3.9.2 Inorganic Fertilisers

Smallholders that use inorganic fertiliser in Morogoro mostly purchase it from the local market/trade store (86.7% of the total number of inorganic fertiliser users). The remaining sources of inorganic fertilisers are minor (Chart 3.100).

Access to inorganic fertiliser is mainly less than 10 km from the household with most households residing between 3 and 10 km from the source (33%), followed by less than 1 km (22%) and between 1 and 3 km (21%) (Chart 3.101). Due to the very small number of households using inorganic fertilisers coupled with the small number of households responding to “non available” (18%) as the reason for not using, it may be assumed that access to inorganic fertiliser is not the main

reason for not using. Other reasons such as cost are more important with 61 percent of households responding to cost factors as the main reason for not using. In other words, it is assumed that if the cost was affordable the demand would be higher and access to inorganic fertiliser would be made more available. More smallholders use inorganic fertilisers in Mvomero than in other districts in Morogoro region (44% of households using inorganic fertilisers), followed by Kilosa (25%) and Kilombero (24%). The other districts use very little inorganic fertiliser.

3.9.3 Improved Seeds

The percent of households that use improved seeds was 15 percent of the total number of crop growing households. Most of the improved seeds are from the local market/trade store (58.4%). Other less important sources of improved seed are from neighbours (24.9%), locally produced by household (4.8%) and development projects (4.0%). Only 1.5 percent of households using improved seed obtain them from large scale farms (Chart 3.102).

Access to improved seed is better than access to chemical inputs with 36 percent of households obtaining the input within 1 km of the household (Chart 3.103). This is in line with the higher use of improved seed compared to other chemical inputs, which further supports the concept

that it is not the availability that is the main issue in the use of inputs but rather other factors such as cost.

The districts that mostly use improved seeds are Mvomero with 44 percent of the total number of households using improved seeds, followed by Kilosa with 19 percent and Kilombero with 14 percent, Morogoro Rural 10 percent, Ulanga 9 percent and Morogoro Urban 4 percent.

3.9.4 Insecticides and Fungicide

Most smallholder households using insecticides and fungicides mainly purchase them from local markets/trade stores (78.7% of the total number of fungicide users), neighbours 7.4 percent, locally produced by household 3.2 percent. Other sources of insecticides/ fungicides are of minor importance (Chart 3.104).

Chart 3.105 shows that there is no distinct pattern for the number of households with varying distances from the source of insecticide/fungicide.

The small number of households using insecticides/fungicides coupled with the 12 percent of households responding to “not available” as the reason for not using it may be assumed that access is not the main reason for not using. Other reasons such as cost are more important with 62 percent of households responding to cost factors as the main reason for not using. In other words, it is assumed that if the cost was affordable, the demand would be higher and access to insecticides/fungicides would be made more available. Fungicides are mostly used in Mvomero district with 51 percent of the total number of households using fungicide, followed by Kilosa (21%) and Ulanga (14%). Insecticides/fungicides use in the other districts is of minor importance.

3.10 Tree Planting

The number of households involved in tree farming was 18,184 representing 7 percent of the total number of agriculture households (Chart 3.106).

The number of trees planted by smallholders on their allotted land was 21,698 trees. The average number of trees planted per household that plants trees on their land was one tree.

The main species planted by smallholders is *Gravellia* spp (17,924 trees, 83%), followed by *Senna* spp. (904, 4%), then *Cyprus* spp. (626, 3%) and *Canophylum Inophylum* (510 trees, 2%). The remaining trees species are planted in

comparatively small numbers (Chart107.). Mvomero has the largest number of smallholders with planted trees than any other district (79%) and is dominated by Gravellia species. This is followed by Ulanga (10%) which is dominated by Gravellia, then Morogoro Urban (5%) and Kilosa (3%) which is mainly planted with Senna spp. (Chart 3.108 and Map 3.39).

Smallholders mostly plant trees on the boundary of fields. The proportion of households that plant on field boundaries is 74 percent, followed by scattered around fields (19%) and then trees planted in a plantation or coppice (7%) (Chart 3.109)

The main purpose of planting trees is to obtain planks/timber (40%). This is followed by shade (30%), wood for fuel (17%) and poles (7%) (Chart 3.110)

3.3.8 Investment in Irrigation and Erosion Control Facilities

Erosion control and water harvesting facilities are grouped together as they normally have dual purposes of reducing erosion and increasing the amount of water available for crop production.

The number of agricultural households that reported the presence of soil erosion and water harvesting facilities in their farms was 8,894. This number represented (3%) of total number of agricultural households in the region. The proportion of farmers with soil erosion control and water harvesting facilities was highest in Mvomero district (28%) followed by Kilosa

(26%), Morogoro Rural (20%), Kilombero (11%), Ulanga (9%) and Morogoro Urban (6%) (Chart 3.112) The erosion control bunds for soil erosion control accounted for 58 percent of the total number of structures built, this was followed by water harvesting bunds (17%), terraces (15%), tree belts (6%), vetiver grass (2%), drainage ditches (1%), dam (0.4%) and gabions/sandbags (0.3%) (Map 3.40)

Erosion control by erosion control bunds, water harvesting bunds and terraces together had 108,277 structures. This represented about 90 percent of the total structures in the region, and the remaining 10 percentages were shared among the rest of the erosion control methods mentioned above.

District-wise, Mvomero and Kilosa districts together were reported to have 4,833 control erosion structures and this is about 2% of the total structures.

3.12 LIVESTOCK RESULTS

3.12.1 Cattle Production

The total number of cattle in the region was 461,063. Cattle are the dominant livestock type in the region followed by goats, sheep and pigs. The region had 2.7 percent of the total cattle population on Tanzania Mainland.

3.12.1.1 Cattle Population

The number of indigenous cattle in Morogoro region was 455,985 (98.9 % of the total number of cattle in the region), 5052 cattle (1.1%) were dairy breeds and 26 cattle (0.006%) were beef breeds.

The census results show that 10,037 agricultural households in the region (88% of total agricultural households) kept 0.46 million cattle. This was equivalent to an average of 46 heads of cattle per cattle-keeping-household. The district with the largest number of cattle was Ulanga which had about 213,593 cattle (46.3% of the total cattle in the region). This was followed by Kilosa (77,655 cattle, 16.8%), Mvomero (71,988 cattle, 15.6%), Kilombero (71,511 cattle, 15.5%), Morogoro Rural (21,601 cattle, 4.7%) and Morogoro Urban (4,716 cattle, 1.0%). (Chart 3.114) (Map 3.41). However Mvomero district had the highest density (29 head per km²) (Map 3.42)

Although Ulanga district had the largest number of cattle in the region, most of it was indigenous. The number of dairy cattle was very small and the number of beef cattle was zero. Morogoro Rural district had the largest number of dairy cattle in the region. In general, the number of beef cattle in the all the districts was zero except in Morogoro Urban with very few beef cattle (Chart 3.115).

3.12.1.2 Herd Size

Thirty five percent of the cattle-rearing households had herds of size 1-5 cattle with an average of three cattle per household. Herd sizes of 6-30 accounted for about 48 percent of all cattle in the region. Only 17 percent of the cattle rearing households had herd sizes of 31- 100 cattle. About 83 percent of total cattle rearing households had herds of size 1-30 cattle and owns 14 percent of total cattle in the region, resulting in an average of 9 cattle per cattle rearing household. There were about 609 households with a herd size of more than 151 cattle each (277,069 cattle in total) resulting in an average of 455 cattle per household.

3.12.1.3 Cattle Population Trend

Cattle population in Morogoro decreased during the period of four years from 237,857 in 1995 to 102,165 cattle in 1998/99. This trend depicts an annual negative growth rate of -15.55 percent (Chart 3.116).

However, there was a very sharp increase in number of cattle for the period of four years from 1998/99 to 2002/03 at the rate of 45.75 percent whereby the number increased from 102,165 to 461,063. However, the number of cattle is estimated to have increased from 237,857 in 1994/95 to 461,063 in 2002/03 at the rate of 7.63 percent.

3.12.1.4 Improved Cattle Breeds

The total number of improved cattle in Morogoro region was 5,078 (5,052 dairy and 26 improved beef). The dairy cattle constituted 1.1 percent of the total cattle and 99.5 percent of improved cattle in the region. The number of beef cattle in the region was insignificant constituting only 0.5 percent of the total number of the improved cattle and 0.005 percent of the total cattle. The number of improved cattle increased from 231 in 1998/99

to 5,052 in 2002/03 at an annual growth rate of 116 percent. The data for improved cattle for the year 1994/95 was not collected (Chart 117).

3.12.2. Goat Production

Goat rearing was the second most important livestock keeping activity in the region followed by sheep and pig rearing. In terms of total number of goats on the Mainland, Morogoro region ranked 17 out of the 21 regions with 2.1 percent of the total goats on the Mainland.

3.12.2.1 Goat Population

The number of goat-rearing-households in Morogoro region was 27,920 (4.3% of all agricultural households in the region) with a total of 243,175 goats giving an average of 9 head of goats per goat-rearing-household. Kilosa had the largest number of goats (104,202 goats, 43% of all goats in the region), followed by Mvomero (58,073 goats, 24%), Morogoro Rural (41,665 goats, 17%), Ulanga (21,181 goats, 9%) and Kilombero (12,554 goats,

5%). Morogoro Urban district had the least number of goats (5,501 goats, 2%) (Chart 3.118) (Map 3.43). However Mvomero had the highest density (24 head per km²)

3.12.2.2 Goat Herd Size

Thirty five percent of the goat-rearing households had herd size of 1-4 goats with an average of 3 goats per goat rearing household. Eighty two percent of total goat-rearing households had herd size of 1-14 goats and owned 52 percent of the total goats in the region resulting in an average of 6 goats per goat-rearing households. The region had 101 households (0.4%) with herd sizes of 40 or more goats each (9,183 goats in total), resulting in an average of 91 goats per household.

3.12.2.3 Goat Breeds

Goat husbandry in the region was dominated by the indigenous breeds that constituted 97.5 percent of the total goats in Morogoro region. Improved goats for meat and dairy goats constituted 0.4 and 2.1 percent of total goats respectively.

3.12.2.4 Goat Population Trend

The overall annual growth rate of goat population from 1994/95 to 2002/03 was -1.40 percent. This negative trend implies eight years of population decrease from 272,162 in 1994/95 to 243,175 in 2002/03. The number of goats decreased from 272,162 in 1994/95 at an estimated annual rate of -4.25 percent to 228,461 in 1998/99. From 1998/99 to 202/03, the goat population increased at an annual rate of 1.57 percent (Chart 119).

3.12.3. Sheep Production

Sheep rearing was the third important livestock keeping activity in Morogoro region after cattle and goats. The region ranked 11 out of 21 Mainland regions and had 2.4 percent of all sheep on Tanzania Mainland.

3.12.3.1 Sheep Population

The number of sheep-rearing households was 7,442 (1.2% of all agricultural households in Morogoro region) rearing 95,680 sheep, giving an average of 13 heads of sheep per sheep-rearing household. The district with the largest number of sheep was Ulanga with 49,823 sheep (52% of total sheep in Morogoro region) followed by Mvomero (17,059 sheep, 18%), Kilosa (15,607 sheep, 16%), Kilombero (7,956 sheep, 8%) and Morogoro Rural (5,096 sheep, 5%). Morogoro Urban district had the least number of sheep (138 sheep, 0.1%) (Chart 3.120 and Map 3.45). Mvomero had the highest density (7 head per km²).

Sheep rearing was dominated by indigenous breeds that constituted 98 percent of all sheep kept in the region. Only 2 percent of the total sheep in the region were improved breeds.

3.12.3.2 Sheep Population Trend

The overall annual growth rate of the sheep population for the eight year period from 1994/95 to 2002/03 is estimated at -0.28 percent. The population decreased at an annual rate of -12.54 percent from 97,871 in 1994/95 to 57,259 in 1998/99. From 1998/99 to 2002/03, sheep population increased at an annual rate of 13.70 percent (Chart 3.121).

3.12.4. Pig Production

Piggery is the least important livestock keeping activity in the region after cattle, goats and sheep. The region ranks 8 out of 21 Mainland regions and is 4 percent of the Mainland total pigs.

The number of pig-rearing agricultural households in Morogoro region was 18,088 (2.8% of the total agricultural households in the region) rearing 44,986 pigs. This gives an average of 3 pigs per pig-rearing household. The district with the largest number of pigs was Mvomero with 22,254 pigs (49% of the total pig population in the region) followed by Kilosa (11,432 pigs, 25%), Morogoro Rural (6,496 pigs, 14%), Ulanga (2,870 pigs, 6%), Kilombero (1,330 pigs, 3%) and Morogoro Urban (604 pigs, 1%) (Chart 3.122 and Map 3.47) However, Mvomero district had the highest density (9 head pre km²) (Map 3.48)

3.12.4.1 Pig Population Trend

The overall annual growth rate of the pig population for the eight years period from 1994/95 to 2002/03 was 14.1 percent. During this period the population grew from 15,682 to 44,986. The pig population increased from 15,682 in 1994/95 to 50,449, in 1998/99 a higher rate of 33.93 percent. The growth rate dropped to -2.82 percent during the following four years from 1998/99 to 2002/03 in which pig population decreased from 50,449 to 44,986 (Chart 3.123).

3.12.5 Chicken Production

The poultry sector in Morogoro region was dominated by chicken production. The region contributed 6.3 percent to the total chicken population on Tanzania Mainland.

3.12.5.1 Chicken Population

The number of households keeping chicken was 154,850 raising about 2,100,861 chickens. This gives an average of 14 chickens per chicken-rearing household. In terms of total number of chickens in the country, Morogoro region was ranked sixth out of the 21 Mainland regions

The District with largest number of chicken was Kilosa with 639,761 chicken (30% of the total chickens in the region) followed by Kilombero (433,045 chicken, 21%), Mvomero (411,992 chicken, 20%), Morogoro Rural (383,509 chicken, 18%), Ulanga (201,607 chicken, 10%) and Morogoro Urban (30,947 chicken, 1%). (Chart 3.124 and Map 3.49). However, Mvomero district had the highest density (167 head per km²) (Map 3.50)

3.12.5.2 Chicken Population Trend

The overall annual chicken population growth rate during the eight-year period from 1995 to 2003 was 4.13 percent. The population increased at a rate of 0.45 percent from 1995 to 1999 after which it increased to 7.94 percent for the four year period from 1999 to 2003 (Chart 3.125).

Ninety eight percent of all chicken in Morogoro region were of indigenous breed. The dominance of indigenous breed makes the population trend for the indigenous chicken more-or-less the same as that of the total chickens in the region.

3.12.5.3 Chicken Flock Size

The results indicate that about 79 percent of all chicken-rearing households were keeping 1-19 chickens with an average of 7 chickens per holder. About 20 percent of holders were reported to be keeping the flock size of 20 to 99 chickens with an average of 32 chickens per holder.

Table 3.13 Number of Household and Chickens Raised by Flock Size

Flock Size	No. of Hh	%	Number of Chicken	Average chicken per household
1 - 4	38527	25	100926	3
5 - 9	41837	27	271789	6
10 - 19	42306	27	538660	13
20 - 29	16841	11	387719	23
30 - 39	7212	5	228874	32
40 - 49	2717	2	113122	42
50 - 99	4786	3	289911	61
100+	624	0.4	169859	272
Total	154850	100	2100861	14

Only 0.4 percent of holders kept the flock sizes of more than 100 chickens at an average of 272 chickens per holder (Table 3.13).

3.12.7 Pest and Parasite Incidence and Control

The results indicate that 28 percent and 21 percent of the total livestock-keeping households reported to have encountered ticks and tsetse fly problems respectively. Chart 3.137 shows that there is a predominance of tick related diseases over tsetse related diseases. Incidences of both problems were highest in Ulanga district but lowest in Mvomero district. (Map 3.51)

The most practiced method of tick control was spraying with 61 percent of all livestock-rearing households in the region using the method. Other methods used were dipping (5.6%), smearing (2.5%) and other traditional methods like hand picking (2.5%). However, 28.4 percent of livestock-keeping households did not use any method.

The most common method used to control tsetse flies was spraying which was

practiced by 67.9 percent of livestock-rearing households this was followed by trapping (3.0%) and dipping (2.3%). However, 26.7 percent of the livestock rearing households did not use any of the three aforementioned methods.

3.12.7.1 Deworming

Livestock rearing households that dewormed their animals were 12,038 (33% of the total livestock rearing households in the region). The percentage of the households that dewormed cattle was 30 percent, goats (57%), sheep (27%) and pigs (31%) (Chart 3.129)

3.12.8. Access to Livestock Services

3.12.8.1 Access to Livestock Extension Services

The total number of households that received livestock advice was 31,171 representing 85 percent of the total livestock-rearing households and 12 percent of the agricultural households in the region. The main livestock extension agent was the government which provided service to about 21 percent of all households receiving livestock extension services. The

rest of the households got services from NGOs/development projects (3%) and large-scale farmers (2%).

3.12.9 Animal Contribution to Crop Production

3.12.9.1 Use of Draft Power

Use of draft animals to cultivate land in Morogoro region is very limited with only 5,810 households (0.90% of the total households in the region) using them (Chart 3.144). Draft animals were used in Kilosa, Ulanga, Kilombero and Mvomero districts only.

The number of households that used draft animals in Kilosa was 2,341 representing 40 percent of the households using draught animals in the region followed by Ulanga 33%, Kilombero 25%, and Mvomero 2%. Use of draft animals was not reported in the other districts (Chart 3.135) (Map 3.52).

The region had 20,104 oxen (Ulanga 10,281, Kilombero 6,466, Kilosa 2,591 and Mvomero 766) that were used to cultivate 17,218 hectares of land. This represents only 0.9 percent of the total oxen found on the Mainland. The largest area cultivated using oxen was found in Ulanga district (8,839 ha, 51.3% of the total area cultivated using oxen).

3.12.9.2 Use of Farm Yard Manure

The number of Households using organic fertilizer in Morogoro region was 14,620 (6% of total crop growing households in the region) (Chart 3.146). The total area applied with organic fertiliser was 12,613 ha of which 7,103 hectares (56% of the total area applied with organic fertiliser or 2.5% of the area planted with annual crops and vegetables in Morogoro region during the long rainy season) was applied with farm yard manure.

Only 5,511 ha (44% of the area of organic fertilizer application) was applied with compost. The largest area applied with farm yard manure was found in Kilosa district with 3,014 hectares (42% of the total area applied with farm yard manure) followed by Mvomero (1,775 ha, 25%), Kilombero (1,448 ha, 20%), Ulanga (440 ha, 6%), Morogoro Rural (286 ha, 4%), and Morogoro Urban (143 ha, 2%) (Chart 3.138)

3.5.0 Fish Farming

The number of households involved in fish farming in Morogoro region was 902 representing 0.3 percent of the total agricultural households in the region (Chart 3.139).

Kilombero was the leading district with 369 households (41% of agricultural households) involved in fish farming. This was followed by Morogoro Rural (363 households, 40%), Kilosa (93 households, 10%) and Ulanga (76 households, 8%). Fish farming was not practiced in Morogoro Urban and Mvomero districts (Chart 3.140 and Map 3.53)).

The main source of fingerings was the non governmental organizations and/or projects which provided fingerings to 55 percent of the fish farming households. About 28 percent of households practicing fish farming got fingerings from their neighbours, 9 percent got them from private trader and 9 percent from other sources.

All fish farming households in the region used the dug-out-pond system and the main fish specie planted is Tilapia. The only type of fish harvested in Morogoro region was Tilapia 191,311 (Chart 3.141). About 72 percent of the fish farming households sold their fish while 28 percent did not sell. All fish were sold to their neighbours.

3.6.0 Access to Infrastructure and Other Services

The results indicate that among the evaluated services, regional capital was a service located very far from most of the household's dwellings than any other service. It was located at an average distance of 161.1 kilometers from the agricultural household's dwellings. Other services and their respective average distances in kilometers from the dwellings were tarmac road (69.8), hospitals (54.2), secondary market (28.8), secondary school (23.7), primary market (19.7), tertiary

3.7.6 Access to Drinking Water

The main source of drinking water for rural agricultural households in Morogoro region was piped water with 24 percent of households using it as the main source during the wet season and 25 percent of the households during the dry seasons. This is followed by surface water (23% of households for each season), protected wells (22% of households for each season), unprotected well (20% of households in the wet season and 19% during dry season) and unprotected spring with 9 percent of households using the source for both seasons. Unprotected rainwater catchments was used as a main source by 0.9 percent of the households in wet season and by 0.3 percent in dry season Chart 3.149)

About 73 percent of the rural agricultural households in Morogoro region were getting drinking water within a distance of less than one kilometer during wet season compared to 66 of the households during the dry season. However, 27 percent of the agricultural households were getting drinking water from a distance of one or more kilometers during wet compared to 34 percent of households in the dry season. In general 92 percent and 85 percent of rural agricultural households in Morogoro region were getting their drinking water within a distance of 2 kms during the wet season dry season respectively (Chart 3.150).

3.7.7 Food Consumption Pattern

3.7.7.1 Number of Meals per Day

The majority of households in Morogoro region normally took 2 meals per day (53.2 percent of the households in the region), 42.6 percent took three meals, 3.5 percent took one meal and 0.7 percent took four meals per day (Chart 3.150)

Morogoro Rural district had the largest number of households that normally takes one meals per day whilst Kilombero had a relatively higher number of households that normally takes three meals per day. In Morogoro region, there were very few households that reported to have taken four meals per day (0.7% of the rural agricultural households) (Table 3.16) (Map 3.56).

3.7.7.2 Meat Consumption Frequencies

The number of agricultural households that had consumed meat during the week preceding the census was 164,669 (63% of the agricultural household in Morogoro region) with 79,176 households (48.1 % of those who consumed meat) consuming meat only once during the respective week. This was followed by those who had meat twice (33.8%), and three times (13.2%). Very few households had meat four or more times during the respective week. About 36.8 percent of the agricultural households in Morogoro region did not eat meat during the week preceding the census (Chart 3.151) (Map 3.57).

3.7.7.3 Fish Consumption Frequencies

The number of agricultural households that had consumed fish during the week preceding the census was 180,756 (69% of the total agricultural household in Morogoro region) with 68,222 households (37.7 % of those who consumed fish) consuming fish twice during the respective week. This was followed by those who had fish twice (30.6%). In general, the percentage of households that consumed fish twice or more during the week preceding the census in Morogoro region was 112,534 (62.3% of the agricultural households that ate fish in the region during the respective period). About 30.7 percent of the agricultural households in Morogoro region did not eat fish during the week preceding the census (Chart 3.160) (Map 3.58).

Table 3.16: Number of Households by Number of Meals the Household Normally Takes per Day and District

District	Number of meals per day								Total
	One	%	Two	%	Three	%	Four	%	
Kilosa	1640	2.2	41720	56.8	28515	38.8	1560	2.1	73435
Morogoro Rural	4707	8.9	33067	62.3	15343	28.9	0	0.0	53117
Kilombero	1006	2.1	17805	36.5	29852	61.2	119	0.2	48782
Ulanga	461	1.5	18416	59.6	11876	38.4	156	0.5	30908
Morogoro Urb	134	3.0	2068	46.6	2232	50.3	0	0.0	4434
Mvomero	1252	2.5	25650	51.2	23167	46.3	0	0.0	50069
Total	9199	3.5	138726	53.2	110985	42.6	1835	0.7	260746

3.7.8 Food Security

In Morogoro region, 90,859 households (34.8% of the total agricultural households in the region) said they rarely experienced problems in satisfying the household food requirements, whilst 21,083 (8.1%) said they sometimes experience problems. However, 11.2 percent of agricultural households in Morogoro region often experienced problems in satisfying their food needs and 8.7 percent of them said they always had problems. About 37.2 percent of the agricultural households said they did not experience any food sufficiency problems (Map 3.59).

3.7.9 Main Sources of Cash Income

The results indicate that selling of food crops was the main cash income earning activity reported by 56.8 percent of all rural agricultural households, followed by casual labour (11.8%), selling of cash crops (9.6%), businesses (8.8%) and sale of forest products (4.3%). Other income earning activities were employment (3.2%), cash remittances (2.3%), sale of livestock (1.6%), sale of livestock products (0.5%) and fishing (0.4%) (Chart 3.152).

MOROGORO PROFILES

This section presents the status of crops and livestock production, access to natural resources and services, demography and poverty for both the region as a whole and for each district.

4.1 Region Profile

The region profile describes the status of the Agriculture sector in the region and compares it with other regions in the country.

4.2 District Profiles

The following district profiles highlight the characteristics of each district and compares them in relation to Population, Main crops and livestock, production and productivity, access to services and resources and levels of poverty.

4.2.1 Kilosa

Kilosa district has the largest number of households in the region and it has one of the highest percent of households involved in smallholder agriculture in the region. Most smallholders are involved in crop farming only, followed by crop and livestock production. It has a very small number of livestock only households and no pastoralists were found in the district.

The most important livelihood activity for smallholder households in Kilosa district is Annual Crop Farming, followed by Off farm Income and tree/forest resources. However, the district ranked third in percent of households with no off-farm activities and the highest percent of households with more than one member with off-farm income. Compared to other districts in the region, Kilosa has a relatively high percent of female headed households (22.9%) and it has one of the second lowest average age of the household head. With an average household size of 4.3 members per household it is average for the region. Kilosa has a comparatively low literacy rate (fifth in the region) among smallholder households and this is reflected by the low level of school attendance in the region. The literacy rate for the heads of household is also moderately good (fifth in region).

It has the smallest utilized land area per household (1.8ha) and the allocated area is fully utilised indicating a high level of land pressure. The total planted area is greater than in other districts in the region due to the presence of good wet and dry seasons, however it has the fourth lowest planted area per household (1.8ha) attributed to the high number of smallholders in the district.

The district is important for maize production in the region with a planted area of over 72,420ha, however the planted area per household is the highest in the region. Paddy production is not important with a planted area of only 13,001 hectares and the production of bulrush millet and finger millets were very small. Kilosa is the only district in the region that produces wheat (238ha). Cassava production is low accounting for 11 percent of the quantity harvested in the region. The district has a large planted area of sweet potatoes (1,666 ha) and it produces irish potatoes and yams in small quantities. The production of beans in Kilosa is much higher than in other districts in the region with a planted area of 7,813ha. Oilseed crops are important in Kilosa accounting to (49 percent) of total production in the region. Vegetable production is important in the district. It has the largest planted area with pumpkins, tomatoes and onions (277 ha, 1,278 ha and 544 ha

respectively) than other districts in the region and accounts for 62 percent of the pumpkins production, 18 percent of the tomatoes production and 71 percent of the onions production in the region. Traditional cotton is the only cash crop grown in the district.

Compared to other districts in the region, Kilosa has a moderate planted area with permanent crops which is dominated by sugarcane (2,588 ha), banana (1,961 ha) and mango (1,433 ha) and coconut (1,397 ha). Other permanent crops are grown small quantities.

As with other districts in the region, most land clearing and preparation is done by hand, however very slightly more land preparation is done by oxen compared to most other districts.

The use of inputs in the region is very small, however district differences exist. Kilosa has the largest planted area with improved seed in Morogoro region and this is due to the higher planted area of vegetables. The district has the largest planted area with Farm yard manure compared to other districts in the region; Kilosa district has a moderate level of insecticide use. The use of fungicides was second high compared to other districts. It has the largest area with irrigation compared to other districts with 17,255 ha of irrigated land. The most common source of water for irrigation is from rivers using gravity. Flood and bucket are the most common means of irrigation water application and a very small amount of sprinkler irrigation is used.

The most common method of crop storage is in locally made traditional structures; however the proportion of households storing crops in the district is lower than other districts in the region. The district has the largest number of households selling crops, however for those who did not sell, the main reason for not selling is open market price too low. Kilosa district is the fourth district in the region with households processing crops and is almost all done by neighbour machine. The district also has a higher percent of households selling processed crops to marketing cooperatives than other districts and no sales are to secondary market and farmers association. Although very small, access to credit in the district is to male only and the main sources are commercial bank, trader/trade store and religious organisations/NGO/ projects.

A comparatively larger number of households receive extension services in Lushoto and all of this is from the government. The quality of extension services was rated between good and average by the majority of the households.

Tree farming is important in Kilosa (with 604 planted trees) and is mostly *Gravellia* with some *Senna* spp and *Leucena* spp. Small proportion of households with erosion control and water harvesting structures is found in Kilosa district and is mostly erosion control bunds, however it also has the highest number of vetiver grass strips than other districts.

The district has the second largest number of cattle in the region and they are almost all indigenous. Goat production is higher compared to other districts, however it has moderate population of sheep in the region. It has the second largest number of pigs and with the highest number of chickens in the region. The district has the highest number of layers in the region. The district has the highest number of ducks and rabbits in the region. Donkeys were not found in the district. The highest number of households reporting Tsetse and tick problems was in Kilosa district and it had the largest number of households de-worming livestock. The use of draft animals in the district is very small and small number of households practice fish farming, however the district has the third largest number in the region.

It has amongst the best access to all weather road and primary schools to other districts. However, it has one of the worst access to secondary school, secondary school, health clinic and regional capital

Kilosa district has the highest percent of households with no toilet facilities, bicycles and mobile phones. It has the third highest number of households using mains electricity in the region. The most common source of energy for lighting is the wick lamp and practically all households use firewood for cooking. The district has almost equal number of households with grass roofs and iron sheets (39%) each. The most common source of drinking water is from surface water. It has high percent of households having two and three meals per day compared to other districts and the lowest percent with one and four meals per day. The district had the highest percent of households that did not eat meat or fish during the week prior to enumeration; however most households seldom or never had problems with food satisfaction.

4.2.2 Morogoro Rural

Morogoro Rural district has the fourth largest number of households in the region and it has a second highest percentage of households involved in smallholder agriculture. Most smallholders are involved in crop farming only, followed by crop and livestock farming. It has a very small number of livestock only households and no pastoralists were found in the district.

The most important livelihood activity for smallholder households in Morogoro Rural district is Annual Crop Farming, followed by Off farm Income. The district has the highest percent of households with no off-farm activities although it has the lowest percent of households with more than one member with off-farm income. Compared to other districts in the region, Morogoro Rural has the second highest percent of female headed households (21.8%) and it has one of the highest average age of the household head in the region. With a household size of 5 members per household it is average for the region. Morogoro Rural has a comparatively high literacy rate among smallholder households and this is reflected by the district having the highest level of school attendance in the region. The literacy rate for the heads of household is also high like other districts in the region.

It has a moderate utilized land area per household (1.6ha) and 90 percent of the allocated area is currently being utilised. The district has the fourth largest planted area in the region and the fifth largest planted area per household (1.4ha)

The district is important for maize production in the region with a planted area of over 32,425 ha, and the planted area per maize growing household is the lowest in the region. The district has a moderate planted area of paddy in the region with 15,910 hectares, however the district has the largest area under sorghum in the region (7,028 ha). Cassava production is high, accounting for 29 percent of the quantity harvested in the region. The production of beans in Morogoro Rural district is the third largest district in the region with a planted area of 1,262ha however the production of cowpeas is the highest than in other district in the region, with a planted area of 1,953ha. Morogoro Rural district has the largest simsim planted area in Morogoro Rural region with a planted area per simsim growing household of 0.47 ha. Vegetable production is moderately important in the district. It has the third largest planted area with tomatoes, chillies and cabbage (1,214 ha, 135 ha and 133 ha respectively) Traditional cash crop (e.g. tobacco) is grown in very small quantities.

Compared to other districts in the region, Morogoro Rural has the second largest planted area with permanent crops which is dominated by coconut (5,086 ha), orange (2,776 ha), banana (2,722 ha) pineapple (2,371 ha) and jack fruit 2,214 ha. Mango, coffee and sugarcane are also grown in smaller quantities.

As with other districts in the region, most land clearing is done by hand slashing; however there is a substantial area with no land clearing indicating bare ground before planting. Practically all Land preparation is done by hand, however a very small amount of land preparation is done by tractor.

The use of inputs in the region is very small, however district differences exist. Morogoro Rural has the fourth largest planted area with improved seed in the region with a least proportion of households using improved seeds. The district has the fourth highest planted area with fertilizers (Farm yard manure, compost and inorganic fertiliser), and most of this is with compost manure. Compared to other districts in the region, Morogoro Rural district has a moderate level of insecticide use. The use of fungicides and herbicides is relatively low. It has the third largest area with irrigation compared to other districts with 13,529 ha of irrigated land. The most common source of water for irrigation is from canal using hand bucket and gravity methods.

The most common method of crop storage in Morogoro Rural district is in sacks/open drum, however the proportion of households storing crops is relatively high. Morogoro Rural has slightly high number of households selling crops, however for those who did not sell, the main reason for not selling is insufficient production. Morogoro Rural is among the districts with the highest percent of households processing crops in Morogoro region and is almost all done by neighbours machine. The district also has the highest percent of households selling processed crops to neighbours than other districts and no sales are to marketing cooperative, large scale farms and trader at farm. Access to credit in the district is mainly to men, however women accounts to 35 percent of household that have access to credits.

A comparatively small number of households receive extension services in Morogoro Rural district and all of this is mainly from the government. The quality of extension services was rated between good and average by the majority of the households.

Tree farming is less important in Morogoro Rural (with 499 planted trees) and is mostly Kyaya and Senna spp. The third highest proportion of households with erosion control and the second with water harvesting structures and is mostly terraces and water harvesting bunds, however it also has the a number of tree belts and vetiver grass.

The district has the fifth largest number of cattle in the region and they are almost all indigenous. Goat production is high compared to other districts; however it has the second lowest population of sheep in the region. It has a moderate number of pigs in the region and a moderate number of chickens. It has a moderate number ducks with no rabbits and donkeys. A number of households reported tsetse and tick problems and it has the second lowest number of households de-worming livestock. Draft animals are not used in the district. A small number of households practice fish farming, however the district has the second largest number in the region.

It has amongst the best worst access to secondary schools, secondary market and among the best access to primary schools compared to other districts. However, it has one of the worst access to regional capital.

The percentage of households without toilet facility in Morogoro Rural district is very low. It is amongst the districts with the lowest percent of households owning wheel barrows, vehicles, bicycles, and land line phones. Though small, the district has the largest number of households using mains electricity in the region. The most common source of energy for

lighting is the wick lamp and practically all households use firewood for cooking. The roofing material for most of the households in the district is grass/leaves (63%), however it has a moderate percent of households with iron sheet roofing (31%) compared to most other districts. The most common source of drinking water is from unprotected well. It is one of the districts with the highest percent of households having two meals per day. The district had fairly moderate percent of households that did not eat meat or fish during the week prior to enumeration and most households seldom had problems with food satisfaction.

4.2.3 Kilombero

Kilombero district has the second largest number of households in the region and it has a third highest percent of households involved in smallholder agriculture in the region. Most smallholders are involved in crop farming only, followed by crop and livestock farming. Household with livestock only and pastoralists were not found in the district.

The most important livelihood activity for smallholder households in Kilombero district is Annual Crop Farming, followed by off farm income. However, the district has the fourth highest percent of households with no off-farm activities and the second highest percent of households with more than one member with off-farm income. Compared to other districts in the region, Kilombero has the lowest percent of female headed households (13.5%) and it has one of the highest average age of the household head in the region. With an average household size of 5.0 members per household it is slightly higher than average for the region. Kilombero district has the highest literacy rate among smallholder households and this is reflected by the concomitant relatively high level of school attendance in the region.

The land area utilized per household (1.9ha) is the second highest in the region and 78 percent of the allocated area is currently being utilized which is the lowest for the region. The district has the third largest planted area in the region, and the fourth largest planted area per household (0.87ha in the long rainy season and 0.72ha in the short rainy season). The planted area in the long rainy season is almost double than that of the short rainy season.

The district is most important for paddy production in the region with a planted area of over 53,096 ha and the planted area per household is 1.2 ha which is above average for the region. Maize production is moderate important with a planted area of only 22,810 hectares, however it is the fourth highest in the region. Sorghum production is less important with a planted area of only 815 ha and is the fourth highest in the region. Irish potatoes and wheat are not produced in the district. The district has the fourth largest planted area of cassava accounting for 13 percent of the cassava planted area in the region. The production of beans in Kilombero district is much lower than in other districts in the region with a planted area of 74ha. Oilseed crops are less important in Kilombero with 16 percent of the groundnuts grown in the district. Vegetable production is not important and tobacco is not grown in the district.

Permanent crops are moderate important in Kilombero district (14% of the total permanent crop planted area in Morogoro region) and is the fourth highest important district in the region. The most prominent permanent crops in the district include sugarcane (5,086 ha), banana (2,776 ha), orange (2,722 ha) and mango (2,371 ha). It is the only district that produces malay apple (74 ha) and it has the highest area with sugarcane in the region (5,086 ha). Other permanent crops are grown in small to medium quantities.

As with other districts in the region, most land clearing is done by hand slashing, however it has the largest area cleared by burning and a relatively small area of bare ground before planting. Practically all Land preparation is done by hand, however small amount of land preparation is done and tractor and oxen.

The use of inputs in the region is very small, however district differences exist. Kilombero has the smallest planted area with improved seed in Morogoro region and this is due to the dominance of permanent crops which do not need frequent planting. The district also has a small planted area with fertilizers (Farm yard manure, compost and inorganic fertiliser), and mostly is with inorganic fertiliser. Compared to other districts in the region, Kilombero district has the smallest area of insecticide and fungicide use and the use of herbicides is relatively high. It has the fourth largest area with irrigation in the region with 9,019 ha of irrigated land. The most common source of water for irrigation is from rivers and wells and almost all water application is by gravity and using hand bucket.

The most common method of crop storage in Kilombero is sacks/open drum, and the proportion of households not storing crops in the district is the lowest for the region. The district has the highest percent of households selling crops, however for those who did not sell, the main reason for not selling is insufficient production. Kilombero district has a second highest percent of households processing crops in the region and is almost done by machine from neighbours. Small quantities of processed crops are sold and very few households have access to credit.

A moderate number of households receive extension services in Kilombero district and almost all of this is from the government. The quality of extension services was rated good by the majority of the households.

Tree farming is less important in Kilombero district (with 240 planted trees) and is mostly *Senna Spp* with some *Tectona Grandis* and *Gravellis*. The least proportion of households with water harvesting bunds is found in Kilombero district and it also has the second least number of erosion control bunds.

The district has a moderate number of cattle in the region and they are almost all indigenous. Goat and sheep production is small compared to other districts. It has the second least number of pigs in the region and the second largest number of chickens, all of which are indigenous. Virtually layers are the only improved chicken found in the district. The district has the third largest number of ducks and rabbits and turkeys are not found in the district. A small number of households reported tsetse and tick problems in Kilombero district. A relative big amount of de-worming of livestock is practiced in the district no draft animals are used. Fish farming is practiced by a small number of households, however the district has the third largest number in the region.

It has amongst the best access to primary school and all weather road compared to other districts. However, it has one of the worst accesses to secondary school, health clinic, secondary market and the regional capital.

The percentage of households without toilet facility in Kilombero district is low for the region, however it has the second highest percent of households with no toilet facilities. It has the lowest percent of households owning land line phones, vehicles and Tv/video and wheel barrow. It has the second highest number of households using mains electricity in the region and the most common source of energy for lighting is the wick lamp and practically all households use firewood for cooking. The district has a high percent of households with grass roofs (60%) and only 37 percent of households have iron sheet roofing. The most common source of drinking water is from unprotected wells. Thirty eighty percent of the households in the district reported having one or two meals per day and only one percent of the households reported having more than three meals per day. The district had a moderate percent of households that did not eat meat and a small percent

of household that did not eat fish during the week prior to enumeration and most households seldom had problems with food satisfaction.

4.2.4 Ulanga

Ulanga district has the least number of households for the region and it has the second smallest percent of households involved in smallholder agriculture in the region. Most smallholders are involved in crop farming only, followed by crop and livestock farming. Household with livestock only and pastoralists were not found in the district.

The most important livelihood activity for smallholder households in Ulanga district is annual crop farming followed by off farm income. It has the lowest percent of households with no off-farm activities and the fourth highest percent of households with more than one member with off-farm income. Compared to other districts in the region, Ulanga district has a relatively high percent of female headed households (20.5%) and it has one of the highest average age of the household head. With an average household size of 5.2 members per household it is higher than the average for the region. Ulanga district has a comparatively lowest literacy rate among smallholder households and this is reflected by low level of school attendance in the region.

It has the fourth largest utilized land area per household (1.8 ha) and only 85 percent of the allocated land area is utilised. The total planted area is the second smallest in the region however it has the second highest planted area per household (0.63ha) in the long rainy season and 0.78ha in the short rainy season.

Ulanga district is less important for maize production in the region with a planted area of only 16,388 ha, and the planted area per household is among the lowest in the region. Paddy production is the second important in the region with a planted area of 30,662 hectares and the production of sorghum is small.

Cassava and bean production in Ulanga district was small and Irish potato and wheat are not grown. Oilseed crops and vegetables are not important in the district however, whilst the district has second smallest planted area with tomatoes it is the least in terms of tomato planted area per household. Traditional cash crops (e.g. tobacco and cotton) are grown in small quantities in the district.

Compared to other districts in the region, Ulanga district has the second smallest planted area with permanent crops (5% of total permanent crop planted area) which is dominated by banana (2,573 ha), mango (1,330 ha) and coconut ((1,049 ha). Medium areas of pawpaw, sugarcane, palm oil are also grown while other cash crops are grown in small quantities.

As with other districts in the region, most land clearing and preparation is done by hand, however the smallest land preparation done by oxen is found in the district.

As with other districts in the region, land clearing by hand slashing is predominant and practically all land preparation is by hand.

The use of inputs in the region is very small, however district differences exist. Ulanga district has among the smallest planted area with improved seed; however it has the second highest planted area per household in the region. The district also has the smallest percent of planted area with fertilizers (Farm yard manure, compost and inorganic fertiliser), and most

of this is with inorganic fertiliser. Compared to other districts in the region, Ulanga district has a moderate area planted with insecticide but has the second highest percent of the total planted area in the region. The percent of planted area with herbicides is the second highest in the region and is amongst the lowest for fungicide and pesticide. It has one of the smallest area of irrigation 5,805 ha. The most common source of water for irrigation is from rivers using hand buckets/ Bucket. Watering cans are the most common means of irrigation water application.

The most common method of crop storage is in sacks/open drum, however the proportion of households not storing crops in Ulanga district is the second lowest in the region. The number of households selling crops in the district is among the highest in the region, however for those who did not sell, the main reason for not selling is insufficient production. The second smallest percent of households processing crops in the region is found in Ulanga district and processing is mostly done by neighbours machine. The district has the fourth largest number of households processing crops on farm by machine. It also has the fourth largest number of households processing crops on farm by hand. Most households that sell crops sell to local market/trade store and no sales are to secondary market nor farmers association. Access to credit in the district is very small.

Although small, Ulanga has the highest percent of households receive extension services in the region and almost all of this is from the government. The quality of extension services was rated between good and average by the majority of the households.

Tree farming is important in Ulanga district (with 2,168 planted trees) and all of them are Gravellis. The largest proportion of households in Ulanga district use erosion control bunds for erosion control.

Ulanga district has the highest number of cattle in the region and most of them are indigenous. It is one of the districts with the fourth highest number of goats in the region. Ulanga district has the highest number of sheep in the region and is also one of the districts with the smallest number of pigs and chicken, however it is the only district with broilers in the region. The district has the highest number of turkeys, moderate number of ducks, small number of rabbits and donkeys are not found in the district. The district has the highest percentage of households reported Tsetse and tick problems and it had one of the highest number of households de-worming livestock. Although small, the use of draft animals in the district is the highest and amongst the four regions that practice fish farming Ulanga district is the least.

It is amongst the districts with the best access to secondary schools, primary schools, feeder roads, all weather roads, health clinics, hospitals, regional capital, tarmac roads and tertiary markets compared to other districts. However, it has the worst access to primary and secondary markets.

Ulanga district has a small number of households with no toilet facilities. The district has low percent of households owning wheel barrows, vehicles and television/video, land line, bicycles and mobile phones and it has high percent of households with radio and the second highest with irons. It has the lowest number of households using mains electricity in the region. The most common source of energy for lighting is the wick lamp and practically all households use firewood for cooking. The district has the largest percent of households with grass roofs with only 23 percent of households having iron sheets. The most common source of drinking water is protected well and it has the second highest percent of households having two or three meal per day compared to other districts and the lowest percent with 3 meals per day. The

district had the highest percent of households that did not eat meat during the week prior to enumeration but has the second lowest percent of households that did not eat fish. Most households seldom had problems with food satisfaction.

4.5 Morogoro Urban

Morogoro Urban district has the second smallest number of households in the region and it has the lowest percent of households involved in smallholder agriculture in the region. Most smallholders are involved in crop farming only, followed by crop and livestock farming. It has a very small number of livestock only households and no pastoralists were found in the district.

The most important livelihood activity for smallholder households in Morogoro Urban district is annual crop farming followed by tree and forest resources, and permanent crop farming. The district has amongst the lowest percent of households with no off-farm activities and the second smallest percent of households with more than one member with off-farm income. Compared to other districts in the region, Morogoro Urban has a second smallest percent of female headed households (17.4%) and it has one of the highest average age of the household head. With an average household size of 5.2 members per household it is slightly lower than the regional average. Morogoro Urban has the second highest literacy rate among smallholder households in the region and this is reflected by the concomitant relatively high level of school attendance. The rate of “Never Attended” is among the lowest in the region.

It has one of the smallest utilized land area per household (1.5 ha) which is slightly lower than the regional average of 1.8 ha per household. The district has smallest planted area in the region, however it has the fourth highest planted area per household (.63 ha) in the long rainy season.

The district is not important for maize production with a planted area of 2,889 ha, however the planted area per household is second lowest in the region. Paddy production is also not important with a planted area of only 497 hectares and the production of sorghum is very small. Wheat and finger millet are not grown in the district. The district has the lowest percent of cassava planted area in the region and it has virtually no Irish with small quantities of sweet potatoes. The production of beans in Morogoro Urban district is the second smallest in the region with a planted area of 1,116 ha and oil crops are not important in the district. Vegetable production is also not important in the district; however the district has second lowest planted area per tomato growing household. Traditional cash crops (e.g. tobacco and cotton) are not grown in the district.

Compared to other districts in the region, Morogoro Urban has a small planted area with permanent crops (571 ha) which is dominated by banana (950 ha) and pigeon pea (319ha), mango (246 ha). Other permanent crops are either not grown or are grown in very small quantities.

As with other districts in the region, most land clearing is done by hand slashing, however “no land clearing” is relatively high indicating bare land before cultivation. Practically all Land preparation is done by hand, however a very small amount of land preparation is done by tractor.

The use of inputs in the region is very small, however district differences exist. Morogoro Urban has one of the smallest planted area with improved seed in Morogoro region however it has the highest percent of planted area using improved

seed. The district has the smallest planted area with fertilizers and most of this is with inorganic fertiliser with small quantities of farm yard manure and compost. Compared to other districts in the region, Morogoro Urban district has the lowest percent of its planted area with insecticides in the region. The use of fungicides, herbicides and pesticide was lowest in the region. It has the smallest planted area with irrigation in the region with only 1,596 ha of irrigated land. Rivers, wells boreholes and canals is used as the source of irrigation water while gravity and hand bucket were the only methods for obtaining water. Buckets/Water cans are the most common means of irrigation water application and a very small amount of flood irrigation is used.

The most common method of crop storage is in locally sacks/open drum; however the proportion of households not storing crops in the district is the highest in the region. The district has the high number of households selling crops and the main reason for not selling is insufficient production. Morogoro Urban district has the highest percent of households processing crops on neighbours machine and a small percent of households selling processed crops mainly to neighbours and local market/trade store. No sales were made to secondary market and farmers association. Access to credit is moderate with women having the second highest percent in the region and the main reason for not using credit is lack of awareness.

A comparatively small number of households receive extension services in Morogoro Urban district and all of this is from the government. The quality of extension services was rated between good and very good by most of the households.

Tree farming is not important in Morogoro Urban (with only 1.084 planted trees) and is mostly with Senna Spp, Cyprus Spp with some Gravellis, Eucalyptus spp and Melicia excelsa. The smallest number of erosion control and water harvesting structures is found in Morogoro Urban district and they are erosion control bunds and terraces.

The district has the smallest number of cattle in the region and they are mostly all indigenous. Goat, sheep and pig production is smallest in the region. It has a comparatively smallest number of chickens. Small numbers of ducks, turkeys and rabbits are found while donkeys are not found in the district. A moderate number of households reported Tsetse and tick problems in Morogoro Urban district and has the moderate number of households de-worming livestock. The use of draft animals in the district is non existent and no fish farming is practiced in the district.

It is amongst the districts with the best access to primary schools and all weather roads however it has one of the worst access to regional capital, secondary markets, health clinics, primary markets, and tarmac roads.

Morogoro Urban district has the lowest percent of households with no toilet facilities. The district has the largest percent of households owning radios and Irons and very small number of households reported ownership of vehicles, mobile phones, wheel barrows and televisions/videos. It has the lowest number of households using mains electricity in the region. The most common source of energy for lighting is the wick lamp and practically all households use firewood for cooking. The district has the smallest percent of households with grass roofs and the highest 63 percent of households having iron sheets. The most common source of drinking water is from surface water, unprotected spring and piped water. It has a moderate percent of households having two or three meal per day compared to other districts. The district had the fourth highest percent of households that did not eat meat during the week prior to enumeration, however it is the least districts with percent of households that did not eat fish during the week. Most households in the district seldom had problems with food satisfaction.

4.6 Mvomero

Mvomero district has a moderate number of households in the region and it has the third highest percents of households involved in smallholder agriculture in the region. Most smallholders are involved in crop farming only, followed by crop and livestock production. It has a very small number of livestock only households and no pastoralists were found in the district.

The most important livelihood activity for smallholder households in Mvomero district is Annual Crop Farming, followed by tree/forest resources, off farm income and keeping/herding. The district has the second lowest percent of households with no off-farm activities however it has the third highest percent of households with more than one member with off-farm income. Compared to other districts in the region, Mvomero has the third highest percent of female headed households (20.8%) and it has one of the moderate average age of the household head. With an average household size of 4.7 members per household it is the average for the region. The literacy rate among smallholder households in Mvomero is low compared to other districts in the region and associated with this is a number of household members who have never attended school.

It has the largest utilized land area per household (1.9 ha) in Morogoro region. The total planted area is the second largest in the region and has the largest planted area in the long rainy season. However the planted area per household in the long rainy season was 0.68ha compared to 0.63 ha per household in the short rainy season.

The district is the second most important for maize production in the region with a planted area of 48,158 ha and the planted area per household is the second largest in the region. Paddy production is third for the region with a planted area of 13,360 hectares and the district has the third planted area per paddy growing household. Production of sorghum is low and there is no production of finger millet in the district. The district also has the largest planted area of beans (9,422 ha), cow peas (1,464 ha) and field peas (872 ha), however very little green gram and chick peas are produced. Cassava production is relatively high accounting for 29 percent of the total cassava planted area in the region. Oilseed crops are important in Mvomero district and has the fourth largest planted in the region. The area under sunflower is the second largest in the region (235 ha) and the third largest planted area of simsim. Vegetable production is not important in the district; however tomatoes, cabbage, onion, chillis, amaranths, carrot, cucumber and pumpkins are produced in very small quantities. Mvomero is among the three districts that cultivates cotton although the planted area is small.

Compared to other districts in the region, Mvomero has the highest planted area with permanent crops which is dominated by mandarine (3,477 ha), sugarcane (2,795 ha), mango (1,983 ha) banana (1,256 ha) and pigeon peas (1,071 ha). Other permanent crops are either not grown or are grown in small quantities.

Most land clearing is done by hand slashing, however it has the highest Planted Area with “no land clearing” indicating the presence of a large area of bare land before cultivation. It has also the second largest area of bush clearance in the region. Most land preparation is done by hand, however it has the highest planted area cultivated by oxen. A very small amount of land preparation is done by tractor.

The use of inputs in the region is very small, however district differences exist. Mvomero has the highest planted area with improved seed in Morogoro region. The use of fertilizer is very small, however inorganic fertilizer is mostly used followed by farm yard manure and compost. Compared to other districts in the region, Mvomero district has the second largest

percentage of the planted area in the district with fungicides application and the highest amount of pesticide was used. It has the largest area with irrigation with a planted area of 17,481 ha under irrigation. The most common source of water for irrigation is from river and canal using gravity. Buckets/Watering cans is the only means of irrigation water application in the district.

The most common method of crop storage is in sacks/open drum; however the proportion of households not storing crops in the district is moderate to low when compared to other districts in Morogoro region. The district has a moderate number of households selling crops, however for those who did not sell, the main reason for not selling is insufficient production. Mvomero is among the districts in Morogoro region with a high percent of households processing crops and is mostly done using neighbours machines. The district also has a small percent of households selling processed crops mostly to neighbours and traders on farm. Access to credit by households in the district is small.

A comparatively small number of households receive extension services in Mvomero district and mostly from the government. The quality of extension services was rated between good and very good by the majority of the households.

Tree farming is the most important in Mvomero district compared to other district (with 17,103 planted trees) and are mostly *Gravellia*, *Calophyllum Inophyllum*, *Cyprus Spp* with some *Eucalyptus Spp* and *Moringa Spp*. A small proportion of households with erosion control and water harvesting structures is found in Mvomero district and is mostly erosion control bunds, water harvesting bunds and tree belts, It also has a small number of drainage ditches for erosion control.

The district has the third largest number of cattle in the region and they are almost all indigenous. Goat population is also the second largest in the region, however it has one of the second largest population of sheep in the region. The district has the highest number of pigs in the region but it has the third largest chicken population, all of which are indigenous. The second largest numbers of ducks, third with turkeys and is the only district with donkeys and rabbits are also found in the district. It has the third highest proportion of households reporting Tsetse and second highest with tick problems in the region and it had a moderate to low number of households de-worming livestock compared to other districts. Draft animals are used to a very small number of household and fish farming is not practiced.

It is amongst the districts with the best access to primary schools and all weather roads, however it has one of the worst access to regional capital, secondary school, tertiary markets, tarmac roads, feeder roads, health clinics and primary markets.

Mvomero district has the fourth highest percent of households with no toilet facilities. Though small, it has the second highest percent of households with radio, however it is among the districts with a low percent of households owning vehicles and land line phones. It has a small number of households using mains electricity. The most common source of energy for lighting is the wick lamp and almost all households use firewood for cooking. The district has a moderate to high percent of households with grass roofs with and 29 percent of households have iron sheet roofing. The most common sources of drinking water are from unprotected wells and piped water. It has the highest percent of households having three meals per day compared to other districts and moderate percent with one or two meals per day. The district has a moderate to high percent of households that did not eat meat or fish during the week prior to enumeration; however most households seldom had problems with food satisfaction.

7.2.25	Number of Agricultural Households, Area Planted (ha) and Quantity of Bitter Aubergine Harvested (tons) by Season and District;2002/03 Agricultural Year	172

7.2.26	Number of Agricultural Households, Area Planted (ha) and Quantity of Onoin Harvested (tons) by Season and District;2002/03 Agricultural Year	172
7.2.27	Number of Agricultural Households, Area Planted (ha) and Quantity of Cabbage Harvested (tons) by Season and District;2002/03 Agricultural Year	173
7.2.28	Number of Agricultural Households, Area Planted (ha) and Quantity of Tomatoes Harvested (tons) by Season and District;2002/03 Agricultural Year	173
7.2.29	Number of Agricultural Households, Area Planted (ha) and Quantity of Spinach Harvested (tons) by Season and District;2002/03 Agricultural Year	173
7.2.30	Number of Agricultural Households, Area Planted (ha) and Quantity of Carrot Harvested (tons) by Season and District;2002/03 Agricultural Year	174
7.2.31	Number of Agricultural Households, Area Planted (ha) and Quantity of Chillies Harvested (tons) by Season and District;2002/03 Agricultural Year	174
7.2.32	Number of Agricultural Households, Area Planted (ha) and Quantity of Amaranths Harvested (tons) by Season and District;2002/03 Agricultural Year	174
7.2.33	Number of Agricultural Households, Area Planted (ha) and Quantity of Pumpkins Harvested (tons) by Season and District;2002/03 Agricultural Year	175
7.2.34	Number of Agricultural Households, Area Planted (ha) and Quantity of Cucumber Harvested (tons) by Season and District;2002/03 Agricultural Year	175
7.2.35	Number of Agricultural Households, Area Planted (ha) and Quantity of Eggplant Harvested (tons) by Season and District;2002/03 Agricultural Year	175
7.2.36	Number of Agricultural Households, Area Planted (ha) and Quantity of Water Mellon Harvested (tons) by Season and District;2002/03 Agricultural Year	176
7.2.37	Number of Agricultural Households, Area Planted (ha) and Quantity of Cauliflower Harvested (tons) by Season and District;2002/03 Agricultural Year	176
7.2.38	Number of Agricultural Households, Area Planted (ha) and Quantity of Cotton Harvested (tons) by Season and District;2002/03 Agricultural Year	176
7.2.39	Number of Agricultural Households, Area Planted (ha) and Quantity of Tobacco Harvested (tons) by Season and District;2002/03 Agricultural Year	177
PERMANENT CROPS		178
7.3	Production of Permanent Crops by Crop Type and District – Morogoro.....	179
7.3	Production of Permanent Crops by Crop Type and District – Morogoro.....	180
7.3	Production of Permanent Crops by Crop Type and District – Morogoro.....	181
7.3	Production of Permanent Crops by Crop Type and District	182
AGROPROCESSING.....		184
8.0a	Number of Crop Growing Households Reported to have Processed Products by District; 2002/03 Agriculture Year.....	185
8.0b	Number of Crop Growing Households by Method of Processing and District; 2002/03 Agricultural Year	185
8.1.1a	Number of Crop Growing Households Processing Crops During 2002/03 Agricultural Year by Location and Crop, Morogoro Region	186
8.1.1b	Number of Crop Growing Households Reporting Processing of Farm Products Produced During 2002/03 Agricultural Year by Use of Product and Crop, Morogoro Region.....	186
8.1.1c	Number of Crop Growing Households Reporting Processing of Farm Products Produced During 2002/03 Agricultural Year by Location of Sale of Product and Crop, Morogoro Region.....	188

8.1.1d	Number of Crop Growing Households By Main Product and District During 2002/03 Agriculture Year, and District	188
8.1.1e	Number of Crop Growing Households By Use of Primary Processed Product and District During 2002/03 Agriculture Year, and District	188
8.1.1f	Number of Crop Growing Households By Where Product Sold and District During 2002/03 Agriculture Year, and District.....	188
8.1.1g	Number of Crop Growing Households By type of By-Product and District During 2002/03 Agriculture Year, and District.....	188
MARKETING		190
10.1	Number of Crop Producing Households Reported to have Sold Agricultural Produce by District During 2002/03; Morogoro Region.....	191
10.2	Number of Households who Reported Main Reasons for Not Selling their Crops by District During 2002/03 Agricultural Year, Morogoro Region	191
10.3	Proportion of Households who Reported Main Reason for Not Selling Their Crops by District during 2002/03 Agricultural Year, Morogoro Region.....	191
IRRIGATION/EROSION CONTROL		192
11.1	Number and Percent of Households Reporting use of irrigation during 2002/03 Agricultural year by District.....	193
11.2	Area (ha) of Irrigatable and NON irrigated land by district during 2002/03 agriculture year	193
11.3	Number of Agriculture Households using irrigation by Source of Irrigation Water by districts during the 2002/03 agricultural Year.....	193
11.4	Number of Agriculture Households by Method used to obtain water and District during 2002/03 Agricultural Year	193
11.5	Number of Agriculture Households by Method of Field Application of Irrigation Water and District for the 2002/03 Agricultural Year.....	194
11.6	Number of Households with Erosion Control/Water Harvesting Facilities on their Land By District	194
11.7	Number of Erosion Control/Water Harvesting Structures By Type and District as of 2002/03 Agricultural Year	194
ACCESS TO FARM INPUTS		196
12.1.1	Number of Crop Growing Households Using Chemical Fertilizer by District, 2002/03 Agricultural Year	197
12.1.2	Number of Crop Growing Households Using Farm Yard Manure by District during 2002/03 Agricultural Year	197
12.1.3	Number of Crop Growing Households Using COMPOST Manure by District during 2002/03 Agricultural Year	197
12.1.4	Number of Crop Growing Households Using Insecticide/Fungicides by District during 2002/03 Agricultural Year	197
12.1.5	Number of Crop Growing Households Using Herbicides by District during 2002/03 Agricultural Year	198
12.1.6	Number of Crop Growing Households using Improved Seeds by District during 2002/03 Agricultural Year	198
12.1.7	Number of Agricultural Households by Source of Chemical Fertilizer and District, 2002/03 Agricultural Year.....	198
12.1.8	Number of Agricultural Households by Source of Farm Yard Manure and District, 2002/03 Agricultural Year.....	199

cont. Number of Agricultural Households by Source of Farm Yard Manure and District, 2002/03 Agricultural Year	199
12.1.9 Number of Agricultural Households and Source of COMPOST Manure by District, 2002/03 Agricultural Year.....	199
12.1.10 Number of Agricultural Households and Source of Insecticides/Fungicides by District, 2002/03 Agricultural Year.....	199
12.1.11 Number of Agricultural Households by Source of Herbicides and District, 2002/03 Agricultural Year.....	200
12.1.12 Number of Agricultural Households Source of Improved Seeds by District, 2002/03 Agricultural Year	200
12.1.13 Number of Agricultural Households and Distance to Source of Chemical Fertilizer by District, 2002/03 Agricultural Year.....	201
12.1.14 Number of Agricultural Households and Distance to Source of Farm Yard Manure by District, 2002/03 Agricultural Year.....	201
12.1.15 Number of Agricultural Households and Distance to Source of COMPOST Manure by District, 2002/03 Agricultural Year.....	201
12.1.16 Number of Agricultural Households and Distance to Source of Pesticides / Fungicides by District, 2002/03 Agricultural Year.....	202
12.1.17 Number of Agricultural Households and Distance to Source of Herbicides by District, 2002/03 Agricultural Year.....	202
12.1.18 Number of Agricultural Households and Distance to Source of Improved Seeds by District, 2002/03 Agricultural Year.....	202
12.1.19 Number of Agricultural Households and Source of Finance for buying Chemical Fertilizer by District, 2002/03 Agricultural Year.....	202
12.1.20 Number of Agricultural Households and Source of Finance for buying Farm Yard Manure by District, 2002/03 Agricultural Year.....	203
12.1.21 Number of Agricultural Households and Source of Finance for buying COMPOST Manure by District, 2002/03 Agricultural Year.....	203
12.1.22 Number of Agricultural Households Source of Finance for buying Pesticides/Fungicides by District, 2002/03 Agricultural Year.....	203
12.1.23 Number of Agricultural Households and Source of Finance for buying Herbicides by District, 2002/03 Agricultural Year.....	203
12.1.24 Number of Agricultural Households and Source of Finance for buying Improved Seeds by District, 2002/03 Agricultural Year.....	204
12.1.25 Number of Agricultural Households and Reason for NOT using Chemical Fertilizer by District, 2002/03 Agricultural Year.....	204
12.1.26 Number of Agricultural Households and Reason for NOT using Farm Yard Manure by District, 2002/03 Agricultural Year.....	205
12.1.27 Number of Agricultural Households and Reason for NOT using COMPOST Manure by District, 2002/03 Agricultural Year.....	205
12.1.28 Number of Agricultural Households and Reason for NOT using Pesticides/Fungicides by District, 2002/03 Agricultural Year.....	206
12.1.29 Number of Agricultural Households and Reason for NOT using Herbicides by District, 2002/03 Agricultural Year.....	206
12.1.30 Number of Agricultural Households and Reason for NOT using Improved Seeds by District, 2002/03 Agricultural Year.....	207
12.1.31 Number of Agricultural Households and Quality of Chemical Fertilizer by District, 2002/03 Agricultural Year.....	207

12.1.32	Number of Agricultural Households and Quality of Farm Yard Manure by District, 2002/03 Agricultural Year.....	207
12.1.33	Number of Agricultural Households and Quality of COMPOST Manure by District, 2002/03 Agricultural Year.....	208
12.1.34	Number of Agricultural Households and Quality of Pesticides/Fungicides by District, 2002/03 Agricultural Year.....	208
12.1.35	Number of Agricultural Households and Quality of Herbicides by District, 2002/03 Agricultural Year.....	208
12.1.36	Number of Agricultural Households and Quality of Improved Seedsby District, 2002/03 Agricultural Year	208
12.1.37	Number of Agricultural Households With Plan to use Next Year Chemical Fertilizer by District, 2002/03 Agricultural Year.....	209
12.1.38	Number of Agricultural Households With Plan to use Next Year Farm Yard Manure by District, 2002/03 Agricultural Year.....	209
12.1.39	Number of Agricultural Households With Plan to use Next Year COMPOST Manure by District, 2002/03 Agricultural Year.....	209
12.1.40	Number of Agricultural Households With Plan to use Next Year Pesticides/Fungicides by District, 2002/03 Agricultural Year.....	209
12.1.41	Number of Agricultural Households With Plan to use Next Year Herbicides by District, 2002/03 Agricultural Year	210
12.1.42	Number of Agricultural Households using Improved Seeds by District, 2002/03 Agricultural Year	210
ACCESS TO EQUIPMENT		211
12.2.1	Number of Equipment/Assets Owned/ Rented by the Household During 2002/03	211
12.2.2	Number of Agricultural Households that used Farm Implements/Assets in 2002/03 by District, 2002/03 Agricultural Year	211
12.2.3	Number of Agricultural Households NOT using Hand Hoe by Main Reason for NOT using and District	212
12.2.4	Number of Agricultural Households NOT using Hand Powered Sprayer by Main Reason for NOT using and District.....	212
12.2.5	Number of Agricultural Households NOT using OXEN by Main Reason for NOT using and District	212
12.2.6	Number of Agricultural Households NOT using OX Plough by Main Reason for NOT using and District.....	213
12.2.7	Number of Agricultural Households NOT using OX SEED PLANTER by Main Reason for NOT using and District	213
12.2.8	Number of Agricultural Households NOT using OX CART by Main Reason for NOT using and District.....	213
12.2.9	Number of Agricultural Households NOT using TRACTOR by Main Reason for NOT using and District	214
12.2.10	Number of Agricultural Households NOT using TRACTOR PLOUGH by Main Reason for NOT using and District.....	214
12.2.11	Number of Agricultural Households NOT using TRACTOR HARROW by Main Reason for NOT using and District	214
12.2.12	Number of Agricultural Households NOT using THRESHERS/SHELLERS by Main Reason for NOT using and District	215
12.2.13	Number of Agricultural Households Owning Hand Hoes by Source of Finance and District	215

12.2.14	Number of Agricultural Households Owning Hand Powered Sprayer by Source of Finance and District.....	215
12.2.15	Number of Agricultural Households Owning OXEN by Source of Finance and District	216
12.2.16	Number of Agricultural Households Owning OX Plough by Source of Finance and District	216
12.2.18	Number of Agricultural Households Owning OX CART by Source of Finance and District.....	216
12.2.19	Number of Agricultural Households Owning TRACTOR by Source of Finance and District.....	217
12.2.20	Number of Agricultural Households Owning TRACTOR PLOUGH by Source of Finance and District	217
12.2.21	Number of Agricultural Households Owning TRACTOR HARROW by Source of Finance and District.....	217
12.2.22	Number of Agricultural Households Owning THRESHERS/SHELLERS by Source of Finance and District	217
AGRICULTURE CREDIT		218
13.1a	Number of Agriculture Households receiving Credit by sex of household head and District During the 2002/03 Agriculture Year.....	219
13.1b	Number of Households Receiving Credit By Main Source of Credit and District; 2002/03 Agriculture Year	219
13.2a	Number of Households Reporting the Main reasons for Not Using Credit by District During the 2002/03 Agriculture Year.....	219
13.2b	Number of Credits Received by Main Purpose of Credit and District During the 2002/03 Agriculture Year.....	219
TREE FARMING AND AGROFORESTRY		220
14.1	Number of Planted Trees by Species and District During the 2002/03 Agriculture Year, Morogoro Region.....	221
	cont. ... ON FARM TREE PLANTING: Number of Planted Trees By Species and District During the 2002/03 Agriculture Year,	221
14.2	Number of Households with planted trees on their land and Number of Trees by Planting Location and District During the 2002/03 Agriculture Year, Morogoro Region.....	221
14.3	Number of Households By Whether Village Have a Community Tree Planting Scheme By District	223
CROP EXTENSION.....		224
15.1	Number of Agriculture Households Receiving Extension Messages by District During the 2002/03 Agriculture Year, Morogoro Region	225
15.2	Number of Households by Quality of Extension Services and District During the 2002/03 Agricultural Year, Morogoro Region.....	225
15.3	Number of Agriculture Households By Source of Crop Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	225
15.4	Number of Agriculture Households Receiving Advice on Plant Spacing by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	226
15.5	Number of Agriculture Households Receiving Advice on Use of Agrochemicals by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region.....	226
15.6	Number of Agriculture Households Receiving Advice on Erosion Control by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region.....	226
15.7	Number of Agriculture Households Receiving Advice on Organic Fertilizer Use by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	227
15.8	Number of Agriculture Households Receiving Advice on Inorganic Fertilizer Use by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	227

15.9	Number of Agriculture Households Receiving Advice on Use of Improved Seeds by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	227
15.10	Number of Agriculture Households Receiving Advice on Use of Mechanization/LST by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	228
15.11	Number of Agriculture Households Receiving Advice on Use of Irrigation Technology by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	228
15.12	Number of Agriculture Households Receiving Advice on Use of Crop Storage by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	228
15.13	Number of Agriculture Households Receiving Advice on Use of Vermin Control by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	229
15.14	Number of Agriculture Households Receiving Advice on Use of Agro-processing by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	229
15.15	Number of Agriculture Households Receiving Advice on Use of Agro-processing by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	229
15.16	Number of Agriculture Households Receiving Advice on Bee keeping by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	230
15.17	Number of Agriculture Households Receiving Advice on Use of Fish Farming by Source of Extension Messages and District During the 2002/03 Agriculture Year, Morogoro Region	230
15.18	Number of Agriculture Households Receiving and Adopting Extension Messages by Type of Message and District (Part 1) During the 2002/03 Agriculture Year, Morogoro Region	230
15.19	Number of Agriculture Households Receiving and Adopting Extension Messages by Type of Message and District (Part 2) During the 2002/03 Agriculture Year, Morogoro Region	231
15.20	Number of Agriculture Households Receiving and Adopting Extension Messages by Type of Message and District (Part 3) During the 2002/03 Agriculture Year, Morogoro Region	231
15.21	Number of Agriculture Households Receiving and Adopting Extension Messages by Type of Message and District (Part 4) During the 2002/03 Agriculture Year, Morogoro Region	231
15.22	Number of Agriculture Households Receiving and Adopting Extension Messages by Type of Message and District (Part 5) During the 2002/03 Agriculture Year, Morogoro Region	232
	ANIMAL CONTRIBUTION TO CROP PRODUCTION	234
17.1	Number of agriculture households using draft animal to cultivate land by District during 2002/03 agriculture year, Morogoro Region	235
17.2	Type of Draft By Number Owned, Used and Area Cultivated (Hectares) By District during 2002/03 agriculture year, Morogoro Region	235
17.3	Number of Crop Growing households using organic fertilizer by District during 2002/03 agriculture year, Morogoro	235
17.4	Area of farm yard manure and Compost Application by District during 2002/03 agriculture year, Morogoro Region	235
	CATTLE PRODUCTION	236
18.1	Total Number Households rearing Cattle by District during 2002/03 agriculture year, Morogoro Region	237
18.2	Number of Cattle By Type and District as of 1st October, 2003	237
18.3	Number of Households Rearing Cattle, Head of Cattle and Average Head per Household by Herd Size as of 1st October, 2003	237
18.4	Number of Cattle by Category and Type of Cattle; on 1st October 2003	237
18.5	Number of Indigenous Cattle by Category and District as on 1st October, 2003	238
18.6	Number of Improved Beef Cattle by Category and District as on 1st October, 2003	238

18.7	Number of Improved Dairy Cattle by Category and District as on 1st October, 2003	238
18.8	Number of Cattle by Category and District as on 1st October, 2003	238
GOATS PRODUCTION		240
19.1	Total Number of Goats by Type and District as on 1st October, 2003	241
19.2	Number of Households Rearing Goats by Herd Size on 1st October, 2003	241
19.3	Total Number of Goats by Category and Type of Goat as of 1st October, 2003 and District	241
19.4	Total Number of Indigenous Goat by Category and District as on 1st October, 2003	242
19.5	Number of Improved Goat for Meat by Category and District as on 1st October, 2003	242
19.6	Number of Improved Dairy Goat by Category and District on 1st October, 2003	242
SHEEP PRODUCTION		244
20.1	Total Number of Sheep by Breed and on 1st October 2003	245
20.2	Number of Households Raising or Managing Sheep by District on 1st October, 2003	245
20.3	Number of Sheep by Type of Sheep and District as 1st October, 2002/03	245
20.4	Number of Households and Heads of Sheep by Herd Size on 1st October 2003	245
20.5	Total Total Number of Indigenous Sheep by Category of Sheep and District as of 1st October	246
20.6	Total Number of Improved Sheep by Category of Sheep and District as of 1st October	246
20.7	Total Number of Sheep by Category of Sheep and District as of 1st October	246
PIGS PRODUCTION		248
21.1	Number of Households and Pigs by Herd Size on 1st October 2003	249
21.2	Number of Households and Pigs by District on 1st October 2003	249
21.3	Number of Pigs by Type and District on 1st October, 2003	249
LIVESTOCK PESTS AND PARASITE CONTROL		250
22.1	Number and Percent of agricultural households reporting to have dewormed animals during 2002/03 Agriculture Year by District, 2002/03 Agricultural Year	251
22.2	Number and Percent of agricultural households reporting to have dewormed animals during 2002/03 Agriculture Year by District and type of dewormed Livestock	251
22.3	Number and Percent of agricultural households reporting to have encountered tick problems during 2002/03 Agriculture Year by District.	251
22.4	Number of Livestock Rearing Households by Methods of Ticks Control Use and District during 2002/03 Agriculture Year and District, 2002/03 Agricultural Year	252
22.5	Number and Percent of agricultural households reporting to have encountered tsetse flies problems during 2002/03 Agriculture Year by District, 2002/03 Agricultural Year	252
22.6	Number and Percent of agricultural households by Method of Tsetse flies Control During the 2002/03 Agriculture Year and District, 2002/03 Agricultural Year	252
OTHER LIVESTOCK		254
23a	Total Number of Other Livestock by Breed and Type	255
23b	Number of households with chicken and Category of Chicken by Flock Size	255
23c	Number of households with chicken and Category of Chicken by Flock Size	255

APPENDIX II

23d	Number of Households Rearing and number of Other Livestock by Type and District.....	255
23e	Number of Chicken by Type and District	256
LIVESTOCK PRODUCT		258
25.1	Number of Eggs, Hides and Skins Sold/Consumed/Utilized by the household By District, during 2002/03 Agricultural Year.....	259
ACCESS TO FUNCTIONAL LIVESTOCK FACILITIES		260
27.1	Number of households by Distance to Nearest Cattle Dip and District	261
27.2	Number of households by Distance to Nearest Spray Raced and District	261
27.3	Number of households by Distance to Nearest Hand Powered Sprayer and District	261
27.4	Number of households by Distance to Nearest Cattle Crush and District.....	262
27.5	Number of households by Distance to Nearest Primary Market and District	262
27.6	Number of households by Distance to Nearest Secondary Market and District	262
27.7	Number of households by Distance to Nearest Abattoir and District.....	263
27.8	Number of households by Distance to Nearest Slaughter Slab and District	263
27.9	Number of households by Distance to Nearest Hide/ Skin Shade and District.....	263
27.10	Number of households by Distance to Nearest Input Supply and District.....	264
27.11	Number of households by Distance to Nearest Veterinary Clinic and District.....	264
27.12	Number of households by Distance to Nearest Village Holding Gound and District.....	264
27.13	Number of households by Distance to Nearest Village Watering Point/ Dam and District	265
27.14	Number of households by Distance to Nearest Drencher and District.....	265
FISH FARMING.....		266
28.1a	Number of Agricultural Households by Fish Farming and District, 2002/03 Agricultural Year	267
28.2a	Number of Agricultural Households By System of Farming and District, 2002/03 Agricultural Year	267
28.2b	Number of Agricultural Households By Source of Fingerings and District, 2002/03 Agricultural Year	267
28.2c	Number of Agricultural Households By Location of Selling Fish and District, 2002/03 Agricultural Year.....	267
28.2d	Total Number of Fish Harvested by Type and District, 2002/03 Agricultural Year.....	267
LIVESTOCK EXTENSION		268
29.1a	Number of Agricultural Households Receiving Advice By Type of Service Provider and District 2002/03 Agricultural Year.....	269
29.1b	Number of Agricultural Households Receiving Extension Advice on Feeds and Proper Feeding By Source and District, 2002/03 Agricultural Year	269
29.1c	Number of Agricultural Households Receiving Extension Advice on Proper Milking By Source and District, 2002/03 Agricultural Year.....	269
29.1d	Number of Agricultural Households Receiving Extension Advice on Milk Hygene By Source and District, 2002/03 Agricultural Year.....	269
29.1e	Number of Agricultural Households Receiving Extension Advice on Disease Control By Source and District, 2002/03 Agricultural Year	270
29.1f	Number of Agricultural Households Receiving Extension Advice on Herd /Flock Size and Selection By Source and District, 2002/03 Agricultural Year.....	270

29.1g	Number of Agricultural Households Receiving Extension Advice Pasture Establishment and Selection By Source and District, 2002/03 Agricultural Year	270
29.1h	Number of Agricultural Households Receiving Extension Advice on Group Formation and Strengthening By Source and District, 2002/03 Agricultural Year	270
29.1i	Number of Agricultural Households Receiving Extension Advice on Calf Rearing By Source and District, 2002/03 Agricultural Year	271
29.1j	Number of Agricultural Households Receiving Extension Advice on Use of Improved Bulls By Source and District, 2002/03 Agricultural Year	271
29.1k	Number of Agricultural Households Receiving Extension Advice on Housing By Source and District, 2002/03 Agricultural Year	271
29.1l	Number of Agricultural Households By Quality of Extension Services and District, 2002/03 Agricultural Year	271
29.1m	Number of Agricultural Households By Source of Extension Services and District, 2002/03 Agricultural Year	272
29.1n	Number of Agricultural Households with/ without Contact farmers/ Group Member and District, 2002/03 Agricultural Year	272
GOVERNMENT REGULATORY PROBLEMS		274
30.1	Number of Agricultural Households by Whether Face Problems with Government Regulation During 2003/04 by District, 2002/03 Agricultural Year	275
LABOUR USE		276
31.1	Number of Households by type of Household member and Activity during the 2002/03 Agriculture Year	277
31.2	Number of Households by type of Household member and Activity during the 2002/03 Agriculture Year	278
ACCESS TO INFRASTRUCTURE AND OTHER SERVICES		280
33.1	Number of Agricultural Households by Distance to Primary School and District, 2002/03 Agricultural Year	281
33.2	Number of Agricultural Households by Distance to Secondary School and District, 2002/03 Agricultural Year	281
33.3	Number of Agricultural Households by Distance to Health Clinic School and District, 002/03 Agricultural Year	281
33.4	Number of Agricultural Households by Distance to Hospital School and District, 2002/03 Agricultural Year	281
33.5	Number of Agricultural Households by Distance to District Capital and District, 2002/03 Agricultural Year	281
33.6	Number of Agricultural Households by Distance to Districtal Capital and District, 2002/03 Agricultural Year	282
33.7	Number of Agricultural Households by Distance to Feeder Road and District, 2002/03 Agricultural Year	282
33.8	Number of Agricultural Households by Distance to All Weather Road and District, 2002/03 Agricultural Year	282
33.9	Number of Agricultural Households by Distance to Tarmac Road and District, 2002/03 Agricultural Year	282
33.10	Number of Agricultural Households by Distance to Primary Market and District, 2002/03 Agricultural Year	282
33.11	Number of Agricultural Households by Distance to Secondary Market and District, 2002/03 Agricultural Year	283
33.12	Number of Agricultural Households by Distance to Tertiary Market and District, 2002/03 agricultural year	283
33.13	Number of Agricultural Households by Distance to Veterinary Clinic and District, 2002/03 agriculture year	283
33.14	Number of Agricultural Households by Distance to Extension Center	283
33.15	Number of Agricultural Households by Distance to Research Station and District, 2002/03 agriculture year	283
33.16	Number of Agricultural Households by Distance to Plant Protection Lab and District, 2002/03 agricultural year	284
33.17	Number of Agricultural Households by Distance to Land Registration Office and District, 2002/03 agricultural year	284

APPENDIX II

33.18	Number of Agricultural Households by Distance to Livestock Development Center	284
33.19	Number of Agricultural Households by Satisfaction of Using Veterinary Clinic and District, 2002/03 agricultural year	284
33.20	Number of Agricultural Households by Satisfaction of Using Extension Center and District, 2002/03 Agricultural Year	284
33.21	Number of Agricultural Households by Satisfaction of Using Research Station and District, 2002/03 Agricultural Year	285
33.22	Number of Agricultural Households by Satisfaction of Using Plant Protection Lab and District 2002/03 Agricultural Year	285
33.23	Number of Agricultural Households by Satisfaction of Using Land Registration Office and District, 2002/03 Agricultural Year	285
33.24	Number of Agricultural Households by Satisfaction of Using Livestock Development Center	285
HOUSEHOLD FACILITIES		286
34.1	Number of households reporting average number of rooms and type of Roofing Materials by District 2002/03 Agriculture Year	287
34.2	Number of Agricultural Households reporting ownership of Assets by District, 2002/03 Agricultural Year	287
34.3	Number of Agricultural Households Reporting Main Source of Energy for Lighting by District 2002/03 Agricultural Year	288
34.4	Number of Agricultural Households Reporting Main Source of Energy for Cooking by District 2002/03 Agricultural Year	288
34.5	Number of Agricultural Households Reporting Main Source of Drinking Water during Wet Season by District 2002/03 Agricultural Year	288
34.6	Number of Agricultural Households Reporting Distance to Main Source of Drinking Water during Wet Season by District, 2002/03 Agricultural Year	289
34.7	Number of Agricultural Households Reporting Time Spent to and from Main Source of Drinking Water during Wet Season by District, 2002/03 Agricultural Year	289
34.8	Number of Agricultural Households Reporting Main Source of Drinking Water during Dry Season by District, 2002/03 agriculture year	289
34.9	Number of Agricultural Households Reporting Distance to Main Source of Drinking Water during Dry Season by District, 2002/03 agriculture year	290
34.10	Number of Agricultural Households Reporting Time Spent to and from Main Source of Drinking Water during Dry Season by District, 2002/03 agriculture year	290
34.11	Number of Agricultural Households Reporting type of TOILET the household normally use by District 2002/03 agriculture year	290
34.12	Number of Households by Number of Days the Household Consumed Fish during the Preceding Week by District	291
34.13	Number of Agricultural Households Reporting Number of days the household Consumed Meat during the Preceding Week by District, 2002/03 agriculture year	291
34.14	Number of Agricultural Households Reporting Number of days the household Consumed Fish during the Preceding Week by District, 2002/03 Agricultural Year	291
34.15	Number of Agricultural Households Reporting the status of food satisfaction of the household during the Preceding Year by District, 2002/03 Agriculture Year	292
34.16	Number of Agricultural Households Reporting Main Source of Income by District, 2002/03 Agricultural Year	292

Definition and working page for page 8**Question Specific definitions (Section 9.0)****Crop Storage, Section 9****Method of Storage (column 4)**

- **Locally made structure:** The structures that have been inherited from their fore fathers
- **Improved locally made structure:** Traditional structures that have been improved using modern technology.
- **Normal duration of storage:** Often there are stored stocks from different seasons and different years. The normal duration refers to the number of months that the most of the crop is stored for.

Marketing problems Q 10.2 and 10.3 col 2:

- **Farmer Association:** A village or community based group of farmers who have formed an organisation to purchase inputs/sell/store their products in order to achieve a better price for their products.
- **Cooperative Union:** Large inter-village /community organisation set up on a district/regional or national basis for providing inputs, marketing and storing farmers products.
- **Government Regulatory board:** Government control body for setting prices and controlling quality of certain agriculture commodities.

Procedures for Questions**Q 9.2 Details of Crop Storage:**

1. For the crops listed indicate if the household stored any during 2002/03 in column 2.
2. Check that the crops correspond to the crop lists in Q 7.1.2, 7.2.2 & 7.3.2. If there is a difference inquire on the reason why. It is possible that a crop was missed during the enumeration of these questions and if so make necessary amendments
3. For the listed crops give details of storage.

Q 10.2 Details on Crop Marketing:

1. For each of the crops listed indicate the main problems in marketing during 2002/03 in column 2.
2. Check if the crops correspond to the crop lists list in Q 7.1.2, 7.2.2 & 7.3.2. If there is a difference inquire on the reason why. It is possible that a crop was missed during the enumeration of these questions and if so make necessary amendments

Q 10.3 Ranking of market problems:

Rank in order of importance the 5 most important marketing problems from the codes in the Market Problems code box.

Definition and working page for page 9	
Overview of Investment activities (Section 11.0)	
Investment activities: Investment activities refer to medium to long term farm development structures and projects. This can be Irrigation structures, erosion and water harvesting structures or other permanent or semi-permanent investment made on the land that the household owns.	
Question Specific Definitions (Q 11.1)	
<p>Source of irrigation Water (Col 1): The main source of water from which water is obtained for irrigation.</p> <p>Method of obtaining water (Col 2): The mechanism by which the water is extracted from the source,</p> <p>Application Method (Col 3): How the water is applied on the field. - Flood - is the application of water down the slope of the land by means of gravity - Sprinkler - is the application of pressurised water through pipes. The water passes through a device which sprays the water onto the crop from above.</p> <p>Irrigatable Area (Col 4): The area the irrigation system is designed to cover in acres.</p> <p>Area of irrigated land this year (Col 5): Area of land under irrigation during the 2002/03 agric year. This is the physical area and NOT the cumulative area of 2 or more croppings.</p>	<p>Q 11.1 Irrigation</p> <ol style="list-style-type: none"> If the hh practices irrigation give details on the main source, main method of obtaining and applying water. Cross check column 8, Q 7.1.2, 7.2.2 & 7.3.2 to check if irrigation was used on any crops.
Question Specific Definitions (Q 11.3)	
<p>Erosion control/water harvesting structure (Col 1)</p> <p>Terraces: Are structures constructed on the side of a hill to provide a level ground to plant crops. They are often used to trap water for paddy/lowland rice production.</p> <p>Erosion Control Bunds: These are banks of earth/stones built perpendicular to the slope to slow down water and prevent erosion. They are different to Terraces in that the soil behind the banks are not level.</p> <p>Gabions: A gabion is a wire mesh box filled with rocks/stones and used to control or prevent gully erosion</p> <p>Sandbags Used to prevent or control gully erosion</p> <p>Tree belts/Wind breaks: A band of trees planted perpendicular to the prevailing wind whose main purpose is to slow down wind speed</p> <p>Water Harvesting bunds: A bank of earth constructed horizontal to the slope of the land to trap water. They are usually banana shaped.</p> <p>Dam: A bank of earth/material which traps river water to form a catchment of water behind it.</p>	<p>Q 11.3 erosion control/water harvesting</p> <ol style="list-style-type: none"> Number of structures refers to the number of working/maintained structures and does not include derelict or irreparable structures. Year of construction refers to the year that the structures were first constructed. It is not the year that the structures were last maintained.
Farm Inputs (Q 12.1.1 to 12.1.7)	
<p>Farm yard Manure: An organic fertiliser made on farm composed of animal dung.</p> <p>Compost: An organic fertiliser made on farm from decomposed plant material</p> <p>Pesticide: Chemical used to either protect the plant from or kill insects, birds, molluscs, mites, etc attacking the plant</p> <p>Fungicide: is a chemical that s used to protect the plant from or control a fungal disease.</p> <p>Herbicide: A chemical used to control weeds.</p>	<p>Q 12.0 Farm Inputs</p> <ol style="list-style-type: none"> Indicate in column 1 whether each of the inputs are used or not. Complete cols 3, 4, 6, and 7 for inputs that are used and place '9' in column 5 (for not applicable). Complete cols 5 & 7 for inputs not used. <p>NOTE: Cross check column 6, 7, 8 & 9 , Q 7.1.2, 7.2.2 & 7.3.2 to check what inputs were used.</p>

12.2 Give details of farm implements and assets used and owned by the household during 2002/03 agriculture year

S/N	Equipment/Asset Name	Number		Used in 2002/03 Yes 1, No=2	Source of Equip-ment	Source of Finance	Reason for not using	Plan to use next year Yes=1, No=2

13.3 If the answer to question 13.1 above is 'NO' what is the reason for not using Credit?

Reason for not using credit (Q13.3) Not needed ...1 Not available ...2 Did not want to go into debt....3 Interest rate/cost too high.....4
 Did not know how to get credit....5 Difficult bureaucratic procedure ...6 Credit granted too late ...7 Other (specify) ...8 Dont know about credit9

Definition and working page for page 10**Question Specific Definitions (Q 12.2)****Farm Implements (Col 1):**

Hand powered Sprayer: Knapsack or bicycle pump sprayer

Reason for not using (Col 6): Be careful about using "too much labour required" as this code generally refers to hand hoes only. The codes for this should "**NOT**" be read out to the farmer as a prompt.

Note: If remittance is given as the main source of finance check for a response to remittances in **question 2.2.5**

Question Specific Definitions (Q 13.0)**Section 13.0 Credit for Agriculture Purposes**

Credit is defined as finance in the form of cash or in-kind contributions (eg direct provision of inputs, machinery, livestock or other material) for the purpose of crop and livestock production whereby the value of the credit must be paid back to the borrower. The value of repayment may either be with interest or interest free.

Credit may be paid back in the form of cash or agriculture produce.

Section 13.0 Credit for Agriculture Purposes

Value of credit: is the amount in cash received from the borrower. If the credit was paid in-kind, estimate the value of this.

Value of repayment: This is the amount to be repaid to the borrower and includes the principal amount (value of credit) plus any interest repayment. If the credit is paid back in agriculture produce, then the cash value of this must be estimated.

Period of repayment: This is the time in **months** the borrower has given for full repayment.

Procedures for questions**Q 12.0 Farm Inputs**

1. Indicate in column 2 and 3 whether each of the implements were used or not.
2. Complete cols 4, 5, 6, and 8 for inputs that are used and place '9' in column 7 (for not applicable).
3. Complete cols 7 & 8 for inputs not used.

Section 13.2 Source of agriculture credit

If the farmer obtained credit from more than one source then use the columns "a", "b" and "c" for the different sources of credit. Start with the main source of credit in column "a".

NOTE: Check for use of inputs in column 7, 8 & 9 of questions 7.1.2, 7.2.2 & 7.3.2.

Working Area/calculation space

14.0 TREE FARMING/AGROFORESTRY

14.1 Did your household have any **Planted Trees** on your land during 2002/03 agric year? (Yes =1, No=2)
 If the response is **'NO'** go to section 14.3

14.2 Give details of the **planted trees** you have on your land.

S/N	Tree Code	Number of trees	Where planted	Main Use	Secondary Use	Number of Plank trees Sold	Number of Pole trees Sold	hh utilised		Total Value (Tsh.)
								Poles	Timber	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
14.2.1	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Definition and working page for page 11	
<p>General Definitions for section 14.0</p> <p>Tree Farming/Agroforestry</p> <p>This section refers to trees planted for wood (firewood, poles, planks, carving, charcoal, medicinal, etc, but NOT fruit trees). It does not include naturally growing trees on the farm (unless special care has been given to promote their establishment) or trees growing naturally on the communal areas.</p> <p>Tree farming is the planting of trees on an area of land for which the main purpose is the production and regeneration of trees for wood on that land.</p> <p>Agroforestry: is the planting of trees on land for the purpose of complementing other farming activities like crop and animal production. For the purpose of this questionnaire Agroforestry trees are trees planted on boundaries and scattered throughout fields. The main productive unit in this case is Crops and Livestock.</p>	<p>Section 14.2 Details of planted trees</p> <ol style="list-style-type: none"> 1. Enter the tree codes of the main species grown by the hh 2. If no planks or poles are sold enter a "0" in columns 8, & 9. 3. Total value includes both value of hh utilised trees and sold trees. 4. If no trees were utilised by the hh or sold enter "0" in column 10
<p>Question Specific Definitions</p> <p>Tree farming (Section 14.0)</p> <p>Pole trees (Col 6): These are young trees which have a maximum diameter of 6 inches at the bottom and are often used for house construction. They are often the thinning harvest after 3 - 5 years.</p> <p>Plank trees (Col 7): Trees for sawing into timber planks.</p> <p>Animal shade: Trees grown for the purpose of providing shade to animals.</p> <p>Community tree planting scheme (Section 14.3)</p> <p>Community Forest: A forest planted on the communal land which is planted, replanted or spot planted by the members of the village.</p> <p>Crop Extension Services (Section 15.1)</p> <p>Contact Farmer: A farmer who is used by the extension agent as a focal point to demonstrate new interventions. The contact farmer then passes on the message to other farmers</p> <p>Group member: Member of a group under which the contact farmer leads</p> <p>Adoption: This is the uptake of an intervention for 2 or more years</p>	<p>Section 15.1 Crop Extension Services</p> <ol style="list-style-type: none"> 1. For each of the extension providers ask if the hh received extension during 2002/2003 agriculture year and indicate in column 2. 2. For each of the providers complete the rest of the columns

Question Specific Definitions

Crop Extension Advice (Section 15.2)

Mechanisation/LST: LST means Labour Saving Technology

Section 16.0 Livelihood constraints

16.1 List the five most important problems in order of most importance:

1. Read out the list of constraints to the respondent and ask him to select the ones that are a problem. Place a ✓ against the constraints that are a problem.
2. Read the selected constraints and ask the farmer to select 5 which create the largest problems
3. Ask the farmer to list these in order of importance and enter in column 2

16.2 List the five least important problems in order of least importance:

1. Read out the list of constraints to the respondent and ask him to select the ones that are **NOT** a problem. Place an ✗ against the constraints that are **NOT** a problem.
2. Read the selected constraints and ask the farmer to select 5 which create the least problems
3. Ask the farmer to list these in order of least importance and enter in column 2

18.0 CATTLE POPULATION, INTAKE AND OFFTAKE

18.1 Did the household own, raise or manage any CATTLE during 2002/03 agriculture year? (Yes =1 No =2)
(If no go to section 19.0)

18.2 Cattle Population as of 1st October 2003

18.3 Cattle Intake during 2002/2003

Definitions and working page for page 13**General definitions for page 13**

Cattle Intake during 2002/03: Cattle purchased, given or born which increases the number of cattle in the herd.

Cattle Offtake during 2002/03:

Cattle removed from the herd, either by selling, hh consumption, given away or stolen.

Question Specific Definitions (Section 18.0)**Cattle type (Q 18.2 & 18.4, Col 1)**

Bull: Mature **Uncastrated** male cattle used for breeding

Cow: Mature female cattle that has given birth at least once

Steer: Castrated male cattle over 1 year

Heifer: Female cattle of 1 year up to the first calving

Calves: Young cattle under 1 year of age

Average Value per Head (Q 18.3, (Col 7 & 9) & 18.4 (Col 3, 5 & 7))

In these columns give the average value per head during 2002/03. For given, traded, consumed by the hh & given away/stolen estimate the value.

Cattle vaccination (18.5 col 1)

ECF: East Coast Fever

FMD: Foot and Mouth Disease

CBPP: Contagious Bovine Pleura Pneumonia

Section 18.0 Cattle Population, Intake & Offtake.

NOTE: Section 18.1 is for the current population (as of 1st October 2003); Section 18.2 and 18.3 is for movement in and out of the herd during the 2002/03 agriculture year. Section 18.4 is for diseases encountered during the agriculture year.

1. If the household has cows, you would normally expect them to have calves in column 8

2. If calves are reported in column 2, 3, or 4 (18.2.6, 18.2.5) then there must be at least that number repeated in column 8

Note: If the farmer reports sales of cattle the importance of this must be reflected in Q 2.2.3

Section 18.5 If cattle are reported to have died in Column 5 then at least that number should be reported in 18.4 col 4

Definitions and working page for page 14

Goat definitions for page 14

Goat Intake during 2002/03: Goat purchased, given or born which increases the number of goats in the herd.

Goat Offtake during 2002/03:

Goat removed from the herd, either by selling, hh consumption, given away or stolen.

Question Specific Definitions (Section 19.0)

Goat type (Q 19.2 & 19.4, Col 1)

Billy Goat (he-goat): Mature **Uncastrated** male goat used for breeding

Castrated goat: Male goat that has been castrated.

She Goat: Mature female goat over 9 months of age

Kid: Young goat under 9 months of age.

Average Value per Head (Q 19.3, (Col 7 & 9) & 19.4 (Col 3, 5 & 7))

In these columns give the average value per head during 2002/03. For given, traded, consumed by the hh & given away/stolen estimate the value.

Goat vaccination (19.5 col 1)

FMD: Foot and Mouth Disease

CCPP: Contagious Caprine Pleura Pneumonia

LSD: Lumpy Skin Disease

Section 19.0 Goat Population, Intake & Offtake.

NOTE: Section 19.1 is for the current population (as of 1st October 2003); Section 19.2 and 18.3 is for movement in and out of the herd during the 2002/03 agriculture year. Section 19.4 is for diseases encountered during the agriculture year.

1. If the household has she goats, you would normally expect them to have kids in column 8
2. If kids are reported in column 2, 3, or 4 (19.2.6, 19.2.5) then there must be at least that number repeated in column 8

Note: If the farmer reports sales of goats the importance of this must be reflected in Q 2.2.3

Section 19.5 If goats are reported to have died in Column 5 then at least that number should be reported in 19.4 col 4

Definition and working page for page 17**Question Specific Definitions Section 26.0)****Procedures for questions****Section 23.0 - Other Livestock:**

1. The current number includes both adult and young animals. For example The number of chickens in col 1 would include adults and chicks.

Question Specific Definitions Section 27.0)**Access to functional Livestock Structures/accessories (Section 27.0):**

NOTE: The structures must be functional. If they are not working/derelect then they should not be included. The distance to the next nearest functional structure should be taken.

Spray Race: A fixed spray structure on an animal race for spraying acaricide

Cattle crush: Corridor structure for restraining cattle.

Abattoir: Large building designed for slaughtering a large amount of animals. It normally has complex structures to assist in the slaughter and storage and a high level of hygiene is maintained.

Slaughter Slab: Concrete slab designed for slaughtering a small amount of animals

Hides: obtained from Cattle

Skins: Obtained from sheep and goats

Hide/Skin Shed: Shed for curing/tanning animal skins and hides

Village holding Pen: Enclosure for containing large amount of livestock which is owned communally.

Drencher: Device for orally administering medicine to livestock. If no product was sold in 2002 enter "0" in columns 6, 7 & 9.

Section 26.0 - Outlets for livestock:

Using the codes enter the outlets for the sale of different livestock in order of importance. If there are, for example, only 2 outlets mark the rest with a "X".

Definitions and working page for page 18

General definitions for Section 28.0

Fish farming: Refers to the rearing/production of fish. It is different to fishing in that the fish have to be reared and fed in fish farming. Fishing traps or captures naturally occurring fish in rivers, lakes and the sea and should not be included in this section.

Question Specific Definitions (Section 28.2)

Production unit number (Col 1): A production unit is a pond river/lake which is treated as a separate entity for the production of fish eg it may be by virtue of manageable size, maturity of fish, type of fish etc. Eg a farmer may have 3 fish ponds. (each one is a separate production unit).

Frequency of stocking (Col 5): What is the number of times the farmer puts new fingerlings into the pond each year.

Fingerlings: These are young immature fish used for stocking ponds.

Sold: (Col 10 & 11)

If no fish were sold enter "0" in column 10 and 11)

Livestock Extension Services (Section 29.1)

Adopted (Col 3): This is the uptake of an intervention for 2 or more years

Livestock Extension Service providers (Section 29.2)

Contact Farmer: A farmer who is used by the extension services as a focal point to demonstrate new interventions to. The contact farmer then passes on the message to other farmers

Adopted (Col 5): This is the uptake of an intervention for 2 or more years

Definition and working page for page 19**Question specific definitions (Section 31.1)****Activity (Col 1):**

Land Clearing: Refers to removing trees/bush/grass prior to ploughing

Soil Preparation: Refers to the seedbed preparation (ploughing, harrowing, etc).

Cattle Rearing: Tending to cattle at home, eg assisting with births, castration, etc. Different livestock keeping activity to herding.

Cattle Herding: Moving livestock from place to place for grazing and water. If herding is carried out the respondent must also give a response to rearing/husbandry

Question Specific Definitions (Section 32.0.0)**Activity (Col 1):**

Subsistence: For the family's survival, rather than for the generation of cash. This includes feeding the hh, provision of water and fuel for cooking. The source of these products are usually from the land resources available to the family. Remember that not all cash earnings are for non subsistence purposes/activities as cash can be used to purchase subsistence items eg food.

Non -subsistence: Cash used for items and activities which are not crucial for the survival of the family. This includes modern medication, non working clothes, refined beer, school fees, etc.

Procedures for (Section 31.1)**Section 31.1 ((Labour use)**

1. For each listed activity in column 1, place a tick in column 2 if any member of the household was involved in that activity during the 2002/03 agriculture year.
2. After completing column 2 return to the first activity in row 27.1.1 and complete column 3.
3. Make sure you stress MAINLY responsible.

NOTE: If an activity has been mentioned previously in the questionnaire eg that the hh keeps chickens, make sure a response is obtained in the appropriate place ie poultry keeping.

If off-farm income generation is mentioned, check for responses to off farm income in other parts of the questionnaire

Section 32.0 - Subsistence vs Non-subsistence

1. For each listed activity in column 1, place a tick in column 2 if any member of the household was involved in that activity during the 2002/03 agriculture year.
2. After completing column 2 return to the first activity in row 32.1.1 and complete column 3 & 4. For each activity make an assessment of the percentage used for subsistence survival and the percent converted to cash for non subsistence goods and items.
3. Make sure you stress MAINLY responsible.

NOTE: Cross check the responses with previous sections in the questionnaire. eg if a response is given to remittances check for an entry in question 2.2.5

Definition and working page for page 20**Household facilities (Section 34):****Number of rooms used for sleeping in the household (Q 34.1)**

Include sitting room, dining room, kitchen, etc if used for sleeping. It also includes rooms outside the main dwelling

A room is defined as a space which is separate from the rest of the building by a permanent wall or division. A building/house that is not divided into rooms is considered to have one room.

Household assets (Q 34.2): these assets must be functioning. Do not include if broken.

Access to drinking water (Q 34.4): If there is more than one source, use the one, which the hh uses most frequently.

Main source of hh cash income:

Activity that provides the hh with the most cash during 2002/03 agriculture year.

Average/maximum yields						Use this table to compare the yields calculated in sections 7.1, 7.2, and 7.3. They are STRICTLY to be used as guidelines only and the sole purpose is to assist in getting the correct area and harvest for each crop

Back Page Reference material

This page contains reference information that may be required to complete some of the questions in the questionnaire.

Weights and measures

1 hectare = 10,000 sq metres (100 x 100 metres)
 1 kilometre = 1000 metres
 1 acre = 4840 square yards (110 x 44 yards)

Conversions

1 hectare = 2.47 acres
 1 mile = 1.61 Kilometres

Kg equivalents

The following standards may be used as a guide to obtain kg if the reported unit is different. Only use these conversions if the respondent is unable to provide weights in kgs.

Crop Name	Number of Kgs

For official use only:

If a question has a query, an indication will be made by the supervisor/data entry controller on the front page of the questionnaire. This space is to note what and where the problem is, the action required to be taken and the responsible person to take follow up action.

Nature of the problem:

Action Required: National supervisor action

Field supervisor action

Overall Status: Does not affect overall integrity of the questionnaire.
 More data is required before it can be used

Discard and resample
 Discard as missing data
